## Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

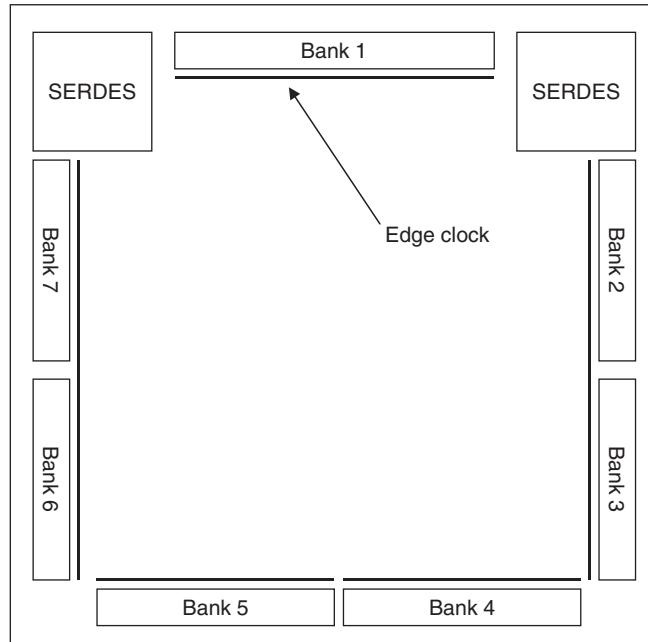

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

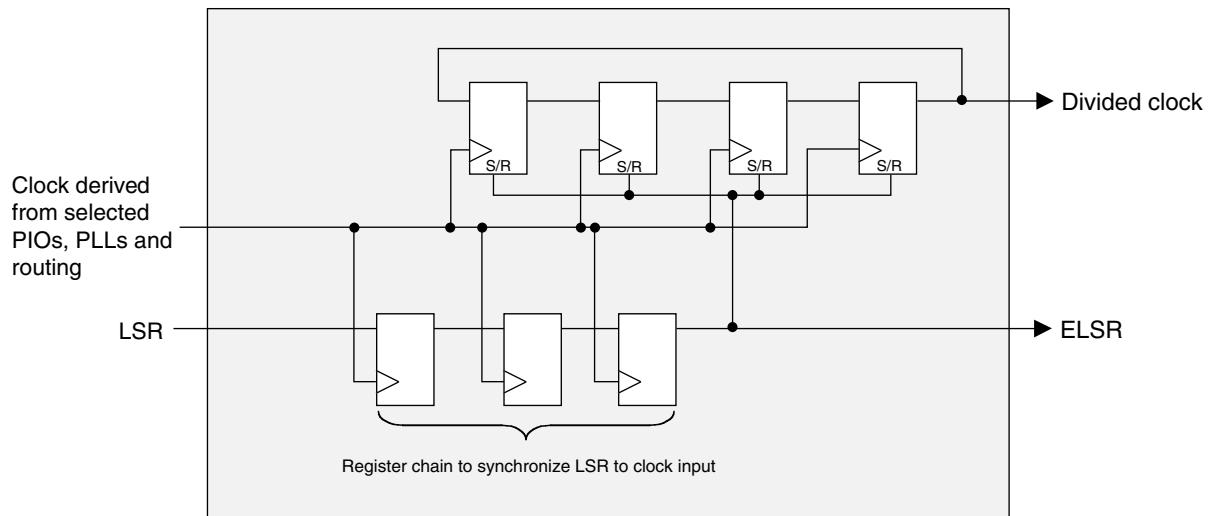

### Details

Product Status	Obsolete
Number of LABs/CLBs	3750
Number of Logic Elements/Cells	15000
Total RAM Bits	1054720
Number of I/O	139
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga15e-5f256i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga15e-5f256i</a>

**Figure 2-7. Edge Clock Resources**

### Precision Clock Divider

Each set of edge clocks has four high-speed dividers associated with it. These are intended for generating a slower speed system clock from the high-speed edge clock. The block operates in a DIV2 or DIV4 mode and maintains a known phase relationship between the divided down clock and high-speed clock based on the release of its reset signal. The clock dividers can be fed from selected PIOs, PLLs and routing. The clock divider outputs serve as primary clock sources. This circuit also generates an edge local set/reset (ELSR) signal which is fed to the PIOs via the edge clock network and is used for the rest of the I/O gearing logic.

**Figure 2-8. Clock Divider Circuit**

### Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is

## PURESPEED I/O Buffer Banks

LatticeSC devices have seven PURESPEED I/O buffer banks; each is capable of supporting multiple I/O standards. Each PURESPEED I/O bank has its own I/O supply voltage ( $V_{CCIO}$ ), and two voltage references  $V_{REF1}$  and  $V_{REF2}$  resources allowing each bank to be completely independent from each other. Figure 2-26 shows the seven banks and their associated supplies. Table 2-7 lists the maximum number of I/Os per bank for the whole LatticeSC family.

In the LatticeSC devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI33 and PCIX33) are powered using  $V_{CCIO}$ . In addition to the bank  $V_{CCIO}$  supplies, the LatticeSC devices have a  $V_{CC}$  core logic power supply, and a  $V_{CCAUX}$  supply that power all differential and referenced buffers.  $V_{CCAUX}$  also powers a predriver of single-ended output buffers to enhance buffer performance.

Each bank can support up to two separate VREF voltages,  $V_{REF1}$  and  $V_{REF2}$  that set the threshold for the referenced input buffers. In the LatticeSC devices any I/O pin in a bank can be configured to be a dedicated reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Differential drivers have user selectable internal or external bias. External bias is brought in by the  $V_{REF1}$  pin in the bank. External bias for differential buffers is needed for applications that require tighter than standard output common mode range.

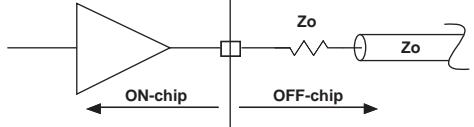

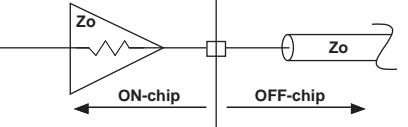

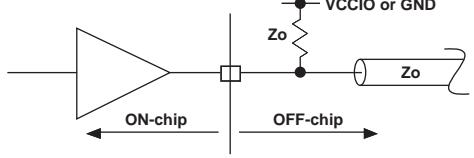

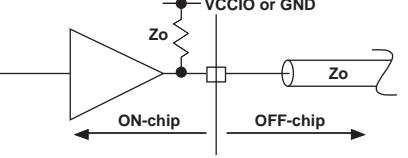

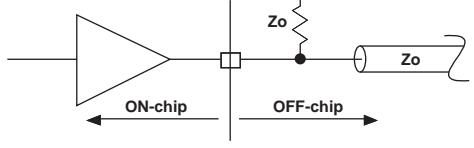

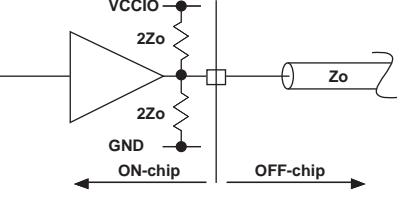

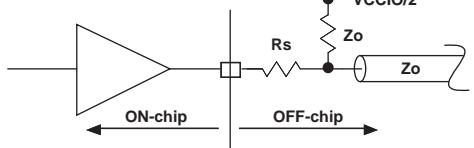

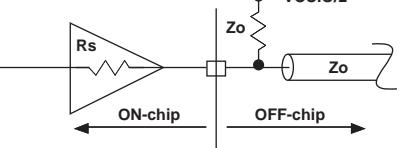

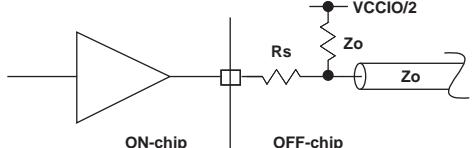

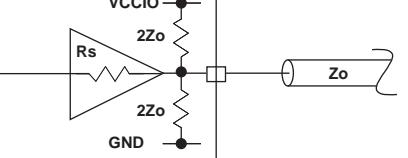

Since a bank can have only one external bias circuit for differential drivers, LVDS and RSDS differential outputs can be mixed in a bank.

If a differential driver is configured in a bank, one pin in that bank becomes a DIFFR pin. This DIFFR pin must be connected to ground via an external 1K +/-1% ohm resistor. Note that differential drivers are not supported in banks 1, 4 and 5.

In addition, there are dedicated Terminating Supply ( $V_{TT}$ ) pins to be used as terminating voltage for one of the two ways to perform parallel terminations. These  $V_{TT}$  pins are available in banks 2-7, these pins are not available in some packages. When VTT termination is not required, or used to provide the common mode termination voltage (VCMT), these pins can be left unconnected on the device. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float.

There are further restrictions on the use of  $V_{TT}$  pins, for additional details refer to technical information at the end of this data sheet.

**Figure 2-27. Output Termination Schemes**

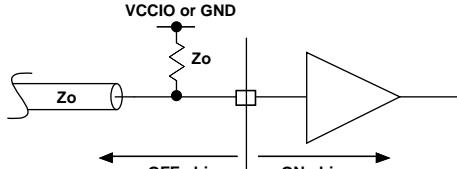

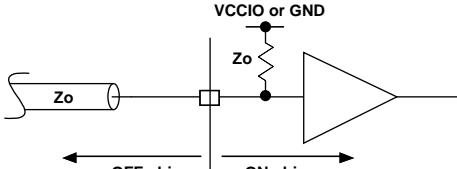

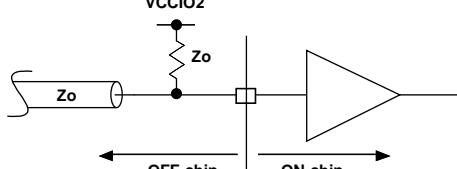

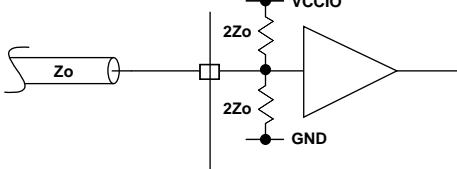

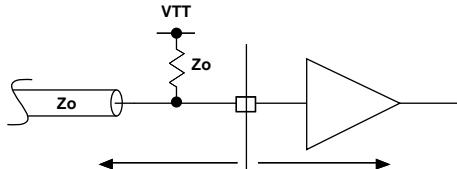

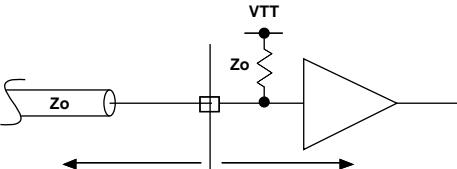

Termination Type	Discrete Off-Chip Solution	Lattice On-Chip Solution
Series termination (controlled output impedance)		
Parallel termination to V <sub>CCIO</sub> or parallel driving end		
Parallel termination to V <sub>CCIO</sub> /2 driving end		
Combined series + parallel termination to V <sub>CCIO</sub> /2 at driving end (only series termination moved on-chip)		
Combined series + parallel to V <sub>CCIO</sub> /2 driving end		

**Single Ended Inputs:** The SC devices support a number of different termination schemes for single ended inputs:

- Parallel to  $V_{CCIO}$  or GND
- Parallel to  $V_{CCIO}/2$
- Parallel to  $V_{TT}$

Figure 2-28 shows the single ended input schemes that are supported. The nominal values of the termination resistors are shown in Table 2-9.

**Figure 2-28. Input Termination Schemes**

Termination Type	Discrete Off-Chip Solution	Lattice On-Chip Solution
Parallel termination to $V_{CCIO}$ , or parallel to GND receiving end		
Parallel termination to $V_{CCIO}/2$ receiving end		
Parallel termination to $V_{TT}$ at receiving end		

In many situations designers can chose whether to use Thevenin or parallel to  $V_{TT}$  termination. The Thevenin approach has the benefit of not requiring a termination voltage to be applied to the device. The parallel to  $V_{TT}$  approach consumes less power.

#### VTT Termination Resources

Each I/O bank, except bank 1, has a number of  $V_{TT}$  pins that must be connected if  $V_{TT}$  is used. Note  $V_{TT}$  pins can sink or source current and the power supply they are connected to must be able to handle the relatively high currents associated with the termination circuits. Note:  $V_{TT}$  is not available in all package styles.

On-chip parallel termination to  $V_{TT}$  is supported at the receiving end only. On-chip parallel output termination to  $V_{TT}$  is not supported.

The  $V_{TT}$  internal bus is also connected to the internal  $V_{CMT}$  node. Thus in one bank designers can implement either  $V_{TT}$  termination or  $V_{CMT}$  termination for differential inputs.

#### DDRII/RDRAMII Termination Support

The DDR II memory and RDRAMII (in Bidirection Data mode) standards require that the on-chip termination to  $V_{TT}$  be turned on when a pin is an input and off when the pin is an output. The LatticeSC devices contain the required circuitry to support this behavior. For additional detail refer to technical information at the end of the data sheet.

December 2011

Data Sheet DS1004

### Absolute Maximum Ratings

Supply Voltage $V_{CC}$ , $V_{CC12}$ , $V_{DDIB}$ , $V_{DDOB}$ .....	-0.5 to 1.6V
Supply Voltage $V_{CCAUX}$ , $V_{DDAX25}$ , $V_{TT}$ .....	-0.5 to 2.75V
Supply Voltage $V_{CCJ}$ .....	-0.5 to 3.6V
Supply Voltage $V_{CCIO}$ (Banks 1, 4, 5) .....	-0.5 to 3.6V
Supply Voltage $V_{CCIO}$ (Banks 2, 3, 6, 7) .....	-0.5 to 2.75V
Input or I/O Tristate Voltage Applied (Banks 1, 4, 5) .....	-0.5 to 3.6V
Input or I/O Tristate Voltage Applied (Banks 2, 3, 6, 7) .....	-0.5 to 2.75V
Storage Temperature (Ambient).....	-65 to 150°C
Junction Temperature Under Bias ( $T_j$ ) .....	+125°C

Notes:

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice Thermal Management document is required.
3. All voltages referenced to GND.
4. Undershoot and overshoot of -2V to ( $VIHMAX + 2$ ) volts is permitted for a duration of <20ns.

### Recommended Operating Conditions

Symbol	Parameter	Min.	Max.	Units
$V_{CC}^5$	Core Supply Voltage (Nominal 1.2V Operation)	0.95	1.26	V
$V_{CCAUX}^6$	Programmable I/O Auxiliary Supply Voltage	2.375	2.625	V
$V_{CCIO}^{1, 2, 5, 6}$	Programmable I/O Driver Supply Voltage (Banks 1, 4, 5)	1.14	3.45	V
$V_{CCIO}^{1, 2, 5, 6}$	Programmable I/O Driver Supply Voltage (Banks 2, 3, 6, 7)	1.14	2.625	V
$V_{CC12}^{4, 5}$	Internal 1.2V Power Supply Voltage for Configuration Logic and FPGA PLL, SERDES PLL Power Supply Voltage and SERDES Analog Supply Voltage	1.14	1.26	V
$V_{DDIB}$	SERDES Input Buffer Supply Voltage	1.14	1.575	V
$V_{DDOB}$	SERDES Output Buffer Supply Voltage	1.14	1.575	V
$V_{DDAX25}$	SERDES Termination Auxiliary Supply Voltage	2.375	2.625	V
$V_{CCJ}^{1, 5}$	Supply Voltage for IEEE 1149.1 Test Access Port	1.71	3.45	V
$V_{TT}^{2, 3}$	Programmable I/O Termination Power Supply	0.5	$V_{CCAUX} - 0.5$	V
$t_{JCOM}$	Junction Temperature, Commercial Operation	0	+85	C
$t_{JIND}$	Junction Temperature, Industrial Operation	-40	105	C

1. If  $V_{CCIO}$  or  $V_{CCJ}$  is set to 2.5V, they must be connected to the same power supply as  $V_{CCAUX}$ .
2. See recommended voltages by I/O standard in subsequent table.
3. When  $V_{TT}$  termination is not required, or used to provide the common mode termination voltage ( $V_{CMT}$ ), these pins can be left unconnected on the device.
4.  $V_{CC12}$  cannot be lower than  $V_{CC}$  at any time. For 1.2V operation, it is recommended that the  $V_{CC}$  and  $V_{CC12}$  supplies be tied together with proper noise decoupling between the digital VCC and analog VCC12 supplies.
5.  $V_{CC}$ ,  $V_{CCIO}$  (all banks),  $V_{CC12}$  and  $V_{CCJ}$  must reach their minimum values before configuration will proceed.
6. If  $V_{CCIO}$  for a bank is nominally 1.2V/1.5V/1.8V, then  $V_{CCAUX}$  must always be higher than  $V_{CCIO}$  during power up.

**Signal Descriptions (Cont.)**

Signal Name	I/O	Description
RESP_[ULC/URC]	—	Calibration resistor to be placed between this pin and either ground or RESPN_[ULC/URC]. RESPN_[ULC/URC] is available on select packages. If available, connection of calibration resistor between RESP_[ULC/URC] and RESPN_[ULC/URC] takes precedence over connection of calibration resistor between RESP_[ULC/URC] and ground. Note: only one per side of the device. Value: 4.02K ohm +/- 1% ohm.
RESPN_[ULC/URC]	—	Available on selected packages. If available, calibration resistor should be placed between RESP_[ULC/URC] and RESPN_[ULC/URC] instead of between RESP_[ULC/URC] and ground. Note: only one per side of the device. Value: 4.02K ohm +/- 1% ohm.
[A:D]_VDDIBx_[L/R]	—	Input buffer power supply for channel x (1.2V/1.5V) on left [L] or right [R] side of device.
[A:D]_VDDOBx_[L/R]	—	Output buffer power supply for channel x (1.2V/1.5V) on left [L] or right [R] side of device.
[A:D]_VDDAX25_[L/R]	—	Auxiliary power for input and output termination (2.5V) on left [L] or right [R] side of device.

1. The ispLEVER software tools may specify VDDRX, VDDTX, VDDP and VCCL pins. These pins should be considered VCC12 pins.

Note: Signals listed as Signal A / Signal B define the same physical pin that is used for different functions based on configuration mode.
