

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	3750
Number of Logic Elements/Cells	15000
Total RAM Bits	1054720
Number of I/O	139
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga15e-6fn256i

Figure 2-21. Input DDR/Shift Register Block

Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the PURESPEED I/O buffers. The block contains a register for SDR operation and a group of registers for DDR and shift register operation. The output signal (DO) can be derived directly from one of the inputs (bypass mode), the SDR register or the DDR/shift register block. Figure 2-22 shows the diagram of the Output Register Block.

Output SDR Register/Latch Block

The SDR register operates on the positive edge of the high-speed clock. It has clock enable that is driven by the clock enable output signal generated by the control MUX. In addition it has a variety of programmable options for set/reset including, set or reset, asynchronous or synchronous Local Set Reset LSR (LSR has precedence over CE) and Global Set Reset GSR enable or disable. The register LSR input is driven from LSRO, which is generated from the PIO control MUX. The GSR inputs is driven from the GSR output of the PIO control MUX, which allows the global set-reset to be disabled on a PIO basis.

Output DDR/Shift Block

The DDR/Shift block contains registers and associated logic that support DDR and shift register functions using the high-speed clock and the associated transfer from the low-speed clock domain. It functions as a gearbox allowing low-speed parallel data from the FPGA fabric be output as a higher speed serial stream. Each PIO supports DDR and x2 shift functions. If desired PIOs A and B or C and D can be combined to form x4 shift functions. Figure 2-22 shows a simplified block diagram of the shift register block.

Figure 2-22. Output Register Block¹**Figure 2-23. Output/Tristate DDR/Shift Register Block**

Table 2-6. Input/Output/Tristate Gearing Resource Rules

PIO	Input/Output Logic			Tri-State/Bidi	
	x1	x2	x4	x1	x2/x4
A	?	?	?	?	N/A
B	?	No I/O Logic	No I/O Logic	?	N/A
C	?	?	No I/O Logic	?	N/A
D	?	No I/O Logic	No I/O Logic	?	N/A

Note: Pin can still be used without I/O logic.

Control Logic Block

The control logic block allows the modification of control signals selected by the routing before they are used in the PIO. It can optionally invert all signals passing through it except the Global Set/Reset. Global Set/Reset can be enabled or disabled. It can route either the edge clock or the clock to the high-speed clock nets. The clock provided to the PIO by routing is used as the slow-speed clocks. In addition this block contains delays that can be inserted in the clock nets to enable Lattice's unique cycle boosting capability.

Update Block

The update block is used to generate the POS update and NEG update signals used by the DDR/Shift register blocks within the PIO. Note the update block is only required in shift modes. This is required in order to do the high speed to low speed handoff. One of these update signals is also selected and output from the PIC as the signal UPDATE. It consists of a shift chain that operates off either the high-speed input or output clock. The values of each register in the chain are set or reset depending on the desired mode of operation. The set/reset signal is generated from either the edge reset ELSR or the local reset LSR. These signals are optionally inverted by the Control Logic Block and provided to the update block as ELSRUP and LSRUP. The Lattice design tools automatically configure and connect the update block when one of the DDR or shift register primitives is used.

Figure 2-25. Update Block

PURE SPEED I/O Buffer

Each I/O is associated with a flexible buffer referred to as PURE SPEED I/O buffer. These buffers are arranged around the periphery of the device in seven groups referred to as Banks. The PURE SPEED I/O buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL. The availability of programmable on-chip termination for both input and output use, further enhances the utility of these buffers.

PURESPEED I/O Buffer Banks

LatticeSC devices have seven PURESPEED I/O buffer banks; each is capable of supporting multiple I/O standards. Each PURESPEED I/O bank has its own I/O supply voltage (V_{CCIO}), and two voltage references V_{REF1} and V_{REF2} resources allowing each bank to be completely independent from each other. Figure 2-26 shows the seven banks and their associated supplies. Table 2-7 lists the maximum number of I/Os per bank for the whole LatticeSC family.

In the LatticeSC devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI33 and PCIX33) are powered using V_{CCIO} . In addition to the bank V_{CCIO} supplies, the LatticeSC devices have a V_{CC} core logic power supply, and a V_{CCAUX} supply that power all differential and referenced buffers. V_{CCAUX} also powers a predriver of single-ended output buffers to enhance buffer performance.

Each bank can support up to two separate VREF voltages, V_{REF1} and V_{REF2} that set the threshold for the referenced input buffers. In the LatticeSC devices any I/O pin in a bank can be configured to be a dedicated reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Differential drivers have user selectable internal or external bias. External bias is brought in by the V_{REF1} pin in the bank. External bias for differential buffers is needed for applications that require tighter than standard output common mode range.

Since a bank can have only one external bias circuit for differential drivers, LVDS and RSDS differential outputs can be mixed in a bank.

If a differential driver is configured in a bank, one pin in that bank becomes a DIFFR pin. This DIFFR pin must be connected to ground via an external 1K +/-1% ohm resistor. Note that differential drivers are not supported in banks 1, 4 and 5.

In addition, there are dedicated Terminating Supply (V_{TT}) pins to be used as terminating voltage for one of the two ways to perform parallel terminations. These V_{TT} pins are available in banks 2-7, these pins are not available in some packages. When VTT termination is not required, or used to provide the common mode termination voltage (VCMT), these pins can be left unconnected on the device. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float.

There are further restrictions on the use of V_{TT} pins, for additional details refer to technical information at the end of this data sheet.

1. Input only.

2. Inputs on chip. Outputs are implemented with the addition of external resistors.

3. Input for this standard does not depend on the value of V_{CCIO} .4. Inputs for this standard cannot be in 3.3V VCCIO banks ($\leq 2.5V$ only).

LatticeSC/M Internal Timing Parameters¹

Signal Descriptions (Cont.)

Signal Name	I/O	Description
RESETN		Reset. (Also sent to general routing). During configuration it resets the configuration state machine. After configuration this pin can perform the global set/reset (GSR) functions or can be used as a general input pin.
CFGIRQN	O	MPI Interrupt request active low signal is controlled by system bus interrupt controller and may be sourced from any bus error or MPI configuration error. It can be connected to one of MPC860 IRQ pins.
TSALLN	I	Tristates all I/O.
Configuration Pads (User I/O if not used. Used during sysCONFIG.)		
HDC/SI	O	<p>High During Configuration is output high until configuration is complete. It is used as a control output, indicating that configuration is not complete.</p> <p>For SPI modes, this pin is used to download the read command and initial read address into the Flash memory device on the falling edge of SCK. This pin will be connected to SI of the memory. If the SPI mode is used, the 8-bit instruction code 0x03 will be downloaded followed by a 24-bit starting address of 0x000000 or a non-zero stat address for partial reconfiguration. If the SPIX mode has been selected, the 8-bit instruction captured on D[7:0] at power-up will be shifted in and followed by a 32-bit starting address of 0x000000.</p>
LDCN/SCS	O	<p>Low During Configuration is output low until configuration is complete. It is used as a control output, indicating that configuration is not complete.</p> <p>For SPI modes, this is an active low chip select for Flash memories. It will go active after INITN goes high but before SCK begins. During power up LDCN will be low. Once INITN goes high, LDCN will go high for 100ns-200ns after which time it will go back low and configuration can begin. During the 100ns-200ns period, the read instruction will be latched for SPIX mode.</p>
DOUT	O	Serial data output that can drive the D0/DIN of daisy-chained slave devices. The data-stream from this output will propagate preamble bits of the bitstream to daisy-chained devices. Data out on DOUT changes on the rising edge of CCLK.
QOUT/CEON	O	<p>During daisy-chaining configuration, QOUT is the serial data output that can drive the D0/DIN of daisy-chained slave devices that do not propagate preamble bits. Data out on QOUT changes on the rising edge of CCLK.</p> <p>During parallel-chaining configuration, active low CEON enables the cascaded slave device to receive bitstream data.</p>
RDN	I	Used in the asynchronous peripheral configuration mode. A low on RDN changes D[7:3] into status outputs. WRN and RDN should not be used simultaneously. If they are, the write strobe overrides.
WRN	I	When the FPGA is selected, a low on the write strobe, WRN, loads the data on D[7:0] inputs into an internal data buffer.
CS0N CS1	I	Used in the asynchronous peripheral, slave parallel and MPI modes. The FPGA is selected when CS0N is low and CS1 is high. During configuration, a pull-up is enabled on both except with MPI DMA access control.
A[21:0]	I/O	In master parallel mode, A[21:0] is an output and will address the configuration EPROMs up to 4 MB space. For MPI configuration mode, A[17:0] will be the MPI address MPI_ADDR[31:14], A[19:18] will be the transfer size and A[21:20] will be the burst mode and burst in process.

LatticeSC/M Family Data Sheet

Revision History

December 2011

Data Sheet DS1004

Date	Version	Section	Change Summary
February 2006	01.0	—	Initial release.
March 2006	01.1	Introduction	SC25 1020 I/O count changed to 476.
		Architecture	Changed ROM 16X4 to ROM 16X2.
			Changed "X2 or X4" to "DIV2 or DIV4".
			Added Global Set/Reset Section.
		DC and Switching Characteristics	Added notes 5 and 6 to Recommended Operating Conditions table.
			Added Power Supply Ramp Rates table.
			Removed -5 and -6 speed grades from Typical Building Block Performance table.
			Added Input Delay Timing table.
			Added Synchronous GSR Timing table.
		Pinout Information	Expanded PROBE_VCC and PROBE_GND description.
			Removed A-RXREFCLKP_[L/R] from Signal Description table.
			Added RESP_[ULC/URC] to Signal Description table.
			Added notes 1 and 2 to Signal Description table.
			Changed number of NCs to 28.
			Changed number of SERDES (signal + power supply) to 74.
			Removed RESP balls from NC list (B2, C2, B29, C29).
			Added note to VTT table.
			Changed RxRefclk (B2 and C2) to NC.
			Added RESP_ULC.
			Added RESP_URC.
			Changed RxRefclk (B29 and C29) to NC.
June 2006	01.2	Introduction	Changed SERDES min bandwidth from 622 Mbps to 600 Mbps.
			Changed max SERDES bandwidth from 3.4 Gbps to 3.8 Gbps.
			Corrected number of package I/Os for the SC80 and SC115 1704 pin packages.
			Updated speed performance for typical functions with ispLEVER 6.0 values.
		Architecture	Changed "When these pins are not used they should be left unconnected." with "Unused VTT pins should be connected to GND if the internal or external VCMT function is not used in the bank. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float."
			Added "SERDES Power Supply Sequencing Requirements" section.
			Changed total bandwidth per quad from 13.6 Gbps to 15.2 Gbps.
			Added the accuracy of the temperature-sensing diode to be typically +/- 10 °C. Also referred to a temperature-sensing diode application note for more information.
			Changed "CTAP" to "internal or external VCMT".
		DC and Switching Characteristics	Changed VCC12 parameter to include VDDP, VDDTX and VDDRX.
			Changed typical values to match ispLEVER 6.0 Power Calculator.

Date	Version	Section	Change Summary
August 2006 (cont.)	01.3 (cont.)	DC and Switching Characteristics (cont.)	Updated LatticeSC Family Timing Adders with ispLEVER 6.0 SP1 results
			Updated PLL Timing Parameters based on PDE testing results
			Removed RDDATA parameter from sysCONFIG readback timing table
		Multiple	Changed TDO/RDDATA to TDO
		Pinout Information	Removed all MPI signals from SC15 256 pin package Dual Function Column
			Added note to SC15, SC25 900 pin package that the package supports a 16 bit MPI
			Added note that pin D3 in an SC15 and SC25 900 pin package should not be used for single-ended outputs
			Added note that pin D28 in an SC15 and SC25 900 pin package should not be used for single-ended outputs
			Added note to SC25 1020 pin package that the package supports a 16 bit MPI
			Added note to SC80 1152 pin package that the package supports a 32 bit MPI
			Added note to SC80 1704 pin package that the package supports a 32 bit MPI
		Ordering Information	Changed "fcBGA" for the 1020 packages to "ffBGA"
November 2006	01.4	Introduction	LatticeSC Family Selection Guide table – I/O count for SC80 device, 1704 fcBGA package changed to 904/32. I/O count for SC115 device, 1704 fcBGA package changed to 942/32.
		DC and Switching Characteristics	DC Electrical Characteristics table – Updated the initialization and standby supply current values.
			DC Electrical Characteristics table – Updated the sysCONFIG Master Parallel mode RCLK low and RCLK high time specifications.
			DC Electrical Characteristics table – Updated VCCIO values for LVPECL33 I/Os.
		Pin Information	Pin Information Summary table - Changed number of single ended user I/Os from 906 to 904 for 1704 fcBGA.
			Removed the single-ended only output restriction on pins D3 and D28 in an SC15 and SC25 900 pin package.
		Ordering Information	Ordering Information tables - Changed number of I/Os from 906 to 904 for 1704 fcBGA.
			Added ordering part numbers for LatticeSC/SCM 40K and 115K LUT devices.
			Added lead-free ordering part numbers.
		Multiple	Changed number of available SC80 I/O from 906 to 904.
			Changed number of available SC115 I/O from 944 to 942.
January 2007	01.4a	Architecture	Added EBR Asynchronous Reset section.
February 2007	01.4b	Architecture	Updated EBR Asynchronous Reset section.
March 2007	01.5	Architecture	Added EBR asynchronous reset clarification
			Clarified that differential drivers are not supported in banks 1, 4 and 5
		DC and Switching Characteristics	Added clarification for the description of the junction temperature specification in the Absolute Maximum Ratings section.
			Updated Initialization and Standby Current table.
			Updated LatticeSC External Switching Characteristics with ispLEVER 6.1 SP1 results.

Date	Version	Section	Change Summary
March 2007 (cont.)	01.5 (cont.)	DC and Switching Characteristics (cont.)	Updated LatticeSC Internal Timing Parameters with ispLEVER 6.1 SP1 results.
			Updated t_{FDEL} and t_{CDEL} specifications.
			Updated LatticeSC Family Timing Adders with ispLEVER 6.1 SP1 results.
			Updated PLL specifications to expand frequency range down to 2 MHz and break out jitter for the different ranges.
			Added footnote to sysCLOCK PLL Timing table specifying the conditions for the jitter measurements.
			Added t_{DLL} specification to sysCLOCK DLL Timing table.
			Added footnote to sysCLOCK DLL Timing table specifying the conditions for the jitter measurements.
			Added sysCONFIG Master Parallel Configuration Mode and sysCONFIG SPI Port to LatticeSC sysCONFIG Port Timing table.
		Pin Information	Updated Pin Information Summary with SC40 information.
			Updated LFSC25 Logic Signal Connections: FF1020 with SC40 information.
			Updated LFSC80 Logic Signal Connections: FC1152 with SC40 information.
August 2007	01.6	General	Changed references of "HDC" to "HDC/SI".
			Changed references of "LDCN" to "LDCN/SCS".
			Changed references of "BUSYN/RCLK" to "BUSYN/RCLK/SCK".
			Changed references of "RDCFGN" to "TSALLN".
			Changed references of "TDO/RDDATA" to "TDO".
		Architecture	Updated text in Ripple Mode section.
			Added information to Global Set/Reset.
			Added information for Spread Spectrum Clocking
			Modified information for PLL/DLL Cascading. DLL to PLL is now supported.
			Modified AIL Block text and figure.
			Modified Figure 2-20 DDR/Shift Register Block.
			Added Information to Hot Socketing.
			Added new information for I/O Architecture Rules.
			Added information to SERDES Power Supply Sequencing Requirements.
		DC and Switching Characteristics	Added footnote to Hot Socketing Specifications table.
			Modified Initialization and Standby Supply Current table.
			Modified GSR Timing table.
			Modified sysCLOCK DLL Timing table to include I_{DUTY} .
			Deleted Readback Timing information from sysCONFIG Port Timing table.
			Modified data in External Switching Characteristics table.
		Pin Information	Added information to the Signal Descriptions table for HDC/SI, LDCN/SCS.
			Added footnote to Signal Descriptions table.
			Modified Description for signal BUSYN/RCLK/SCK.
			Modified data in Pin Information Summary and device-specific Pinout Information tables.
