Welcome to [E-XFL.COM](#)**Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

**Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

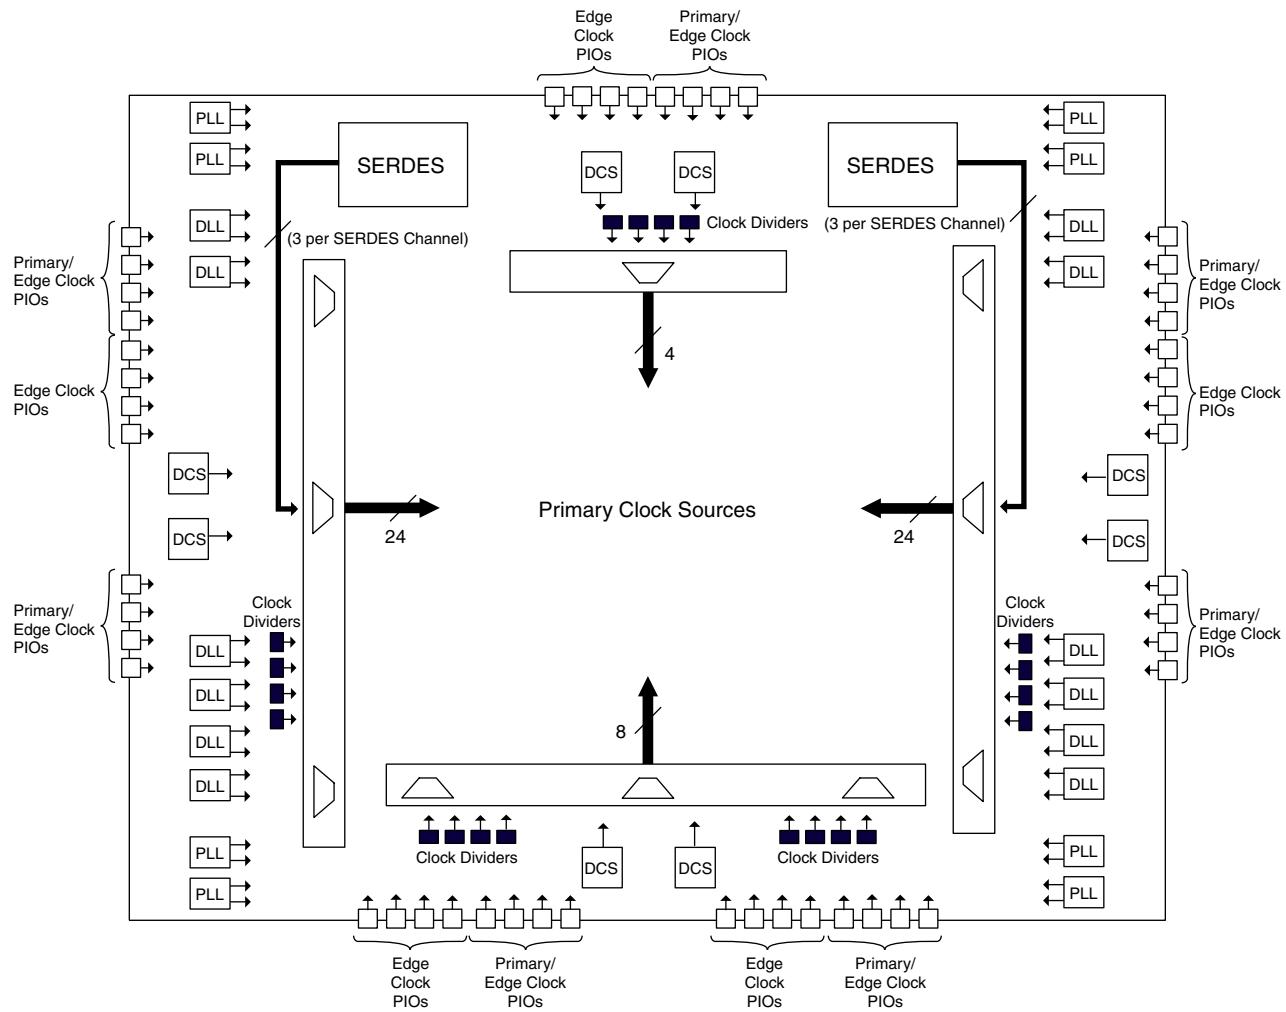

**Details**

|                                |   |
|--------------------------------|---|
| Product Status                 | Obsolete  |
| Number of LABs/CLBs            | 6250  |
| Number of Logic Elements/Cells | 25000   |
| Total RAM Bits                 | 1966080   |
| Number of I/O                  | 476   |
| Number of Gates                | -   |
| Voltage - Supply               | 0.95V ~ 1.26V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | -40°C ~ 105°C (TJ)  |
| Package / Case                 | 1020-BBGA, FCBGA  |
| Supplier Device Package        | 1020-OFcBGA Rev 2 (33x33)   |

- Two outputs per PLL
- Clock divider outputs
- Digital Clock Select (DCS) block outputs
- Three outputs per SERDES quad

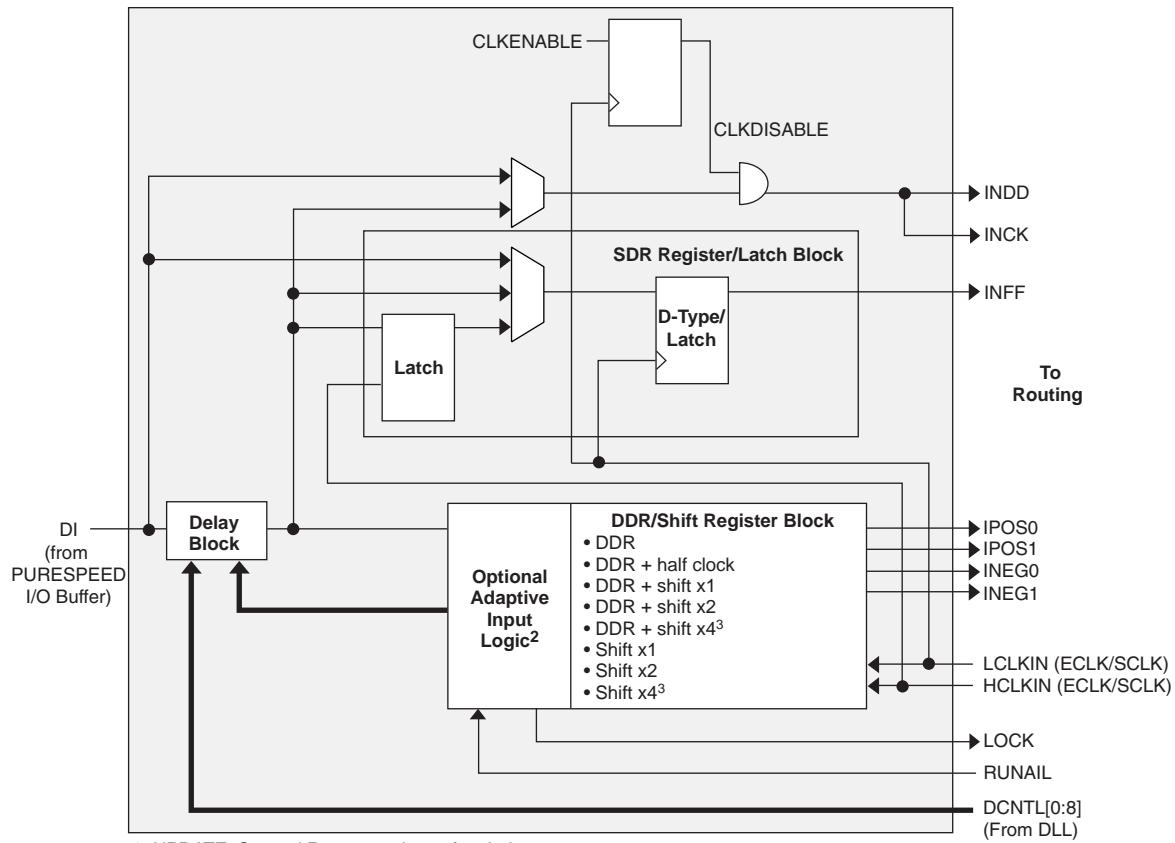

Figure 2-5 shows the arrangement of the primary clock sources.

**Figure 2-5. Clock Sources**

## Primary Clock Routing

The clock routing structure in LatticeSC devices consists of 12 Primary Clock lines per quadrant. The primary clocks are generated from 64:1 MUXes located in each quadrant. Three of the inputs to each 64:1 MUX comes from local routing, one is connected to GND and rest of the 60 inputs are from the primary clock sources. Figure 2-6 shows this clock routing.

Figure 2-20. Input Register Block<sup>1</sup>

1. UPDATE, Set and Reset not shown for clarity

2. Adaptive input logic is only available in selected PIO

3. By four shift modes utilize DDR/shift register block from paired PIO.

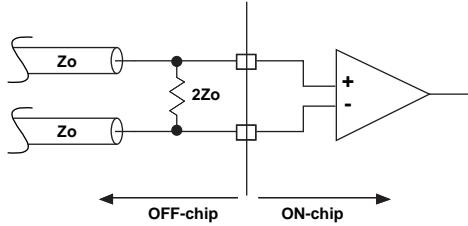

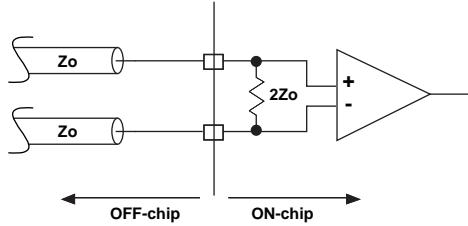

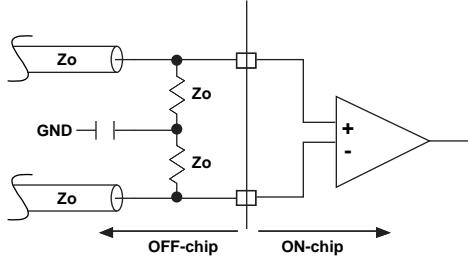

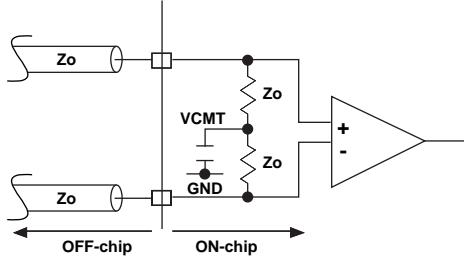

4. CLKDISABLE is used to block the transitions on the DQS pin during post-amble. Its main use is to disable DQS (typically found in DDR memory interfaces) or other clock signals. It can also be used to disable any/all input signals to save power.

**Differential Input Termination**

The LatticeSC device allows two types of differential termination. The first is a single resistor across the differential inputs. The second is a center-tapped system where each input is terminated to the on-chip termination bus  $V_{CMT}$ . The  $V_{CMT}$  bus is DC-coupled through an internal capacitor to ground.

Figure 2-29 shows the differential termination schemes and Table 2-9 shows the nominal values of the termination resistors.

**Figure 2-29. Differential Termination Scheme**

| Termination Type                         | Discrete Off-Chip Solution   | Lattice On-Chip Solution  |
|--|--|---|
| Differential termination                 |   |   |
| Differential and common mode termination |  |  |

**Calibration**

There are two calibration sources that are associated with the termination scheme used in the LatticeSC devices:

- DIFFR – This pin occurs in each bank that supports differential drivers and must be connected through a  $1K\pm 1\%$  resistor to ground if differential outputs are used. Note that differential drivers are not supported in banks 1, 4 and 5.
- XRES – There is one of these pins per device. It is used for several functions including calibrating on-chip termination. This pin should always be connected through a  $1K\pm 1\%$  resistor to ground.

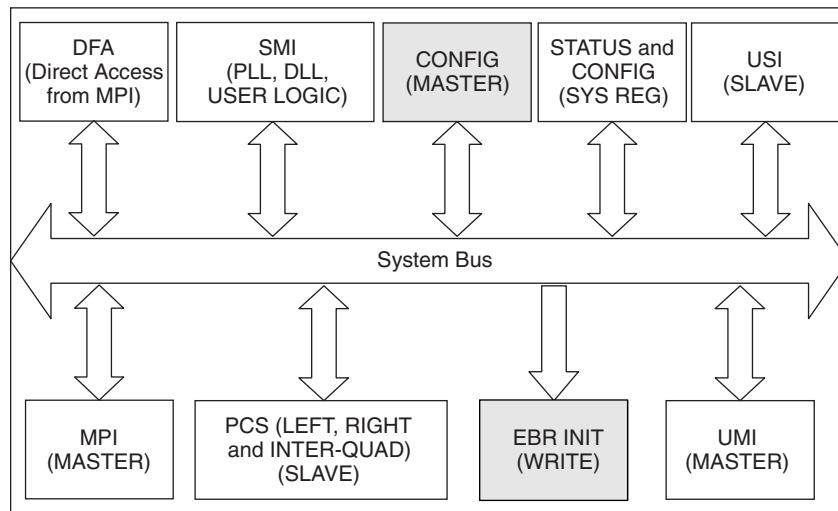

The LatticeSC devices support two modes of calibration:

- Continuous – In this mode the SC devices continually calibrate the termination resistances. Calibration happens several times a second. Using this mode ensures that termination resistances remain calibrated as the silicon junction temperature changes.
- User Request – In this mode the calibration circuit operates continuously. However, the termination resistor values are only updated on the assertion of the calibration\_update signal available to the core logic.

For more information on calibration, refer to the details of additional technical documentation at the end of this data sheet.

**Hot Socketing**

The LatticeSC devices have been carefully designed to ensure predictable behavior during power-up and power-down. To ensure proper power sequencing, care must be taken during power-up and power-down as described below. During power-up and power-down sequences, the I/Os remain in tristate until the power supply voltage is high enough to ensure reliable operation. In addition, leakage into I/O pins is controlled to within specified limits,

**Figure 2-31. LatticeSC System Bus Interfaces**

Several interfaces exist between the System Bus and other FPGA elements. The MPI interface acts as a bridge between the external microprocessor bus and System Bus. The MPI may work in an independent clock domain from the System Bus if the System Bus clock is not sourced from the external microprocessor clock. Pipelined operation allows high-speed memory interface to the EBR and peripheral access without the requirement for additional cycles on the bus. Burst transfers allow optimal use of the memory interface by giving advance information of the nature of the transfers.

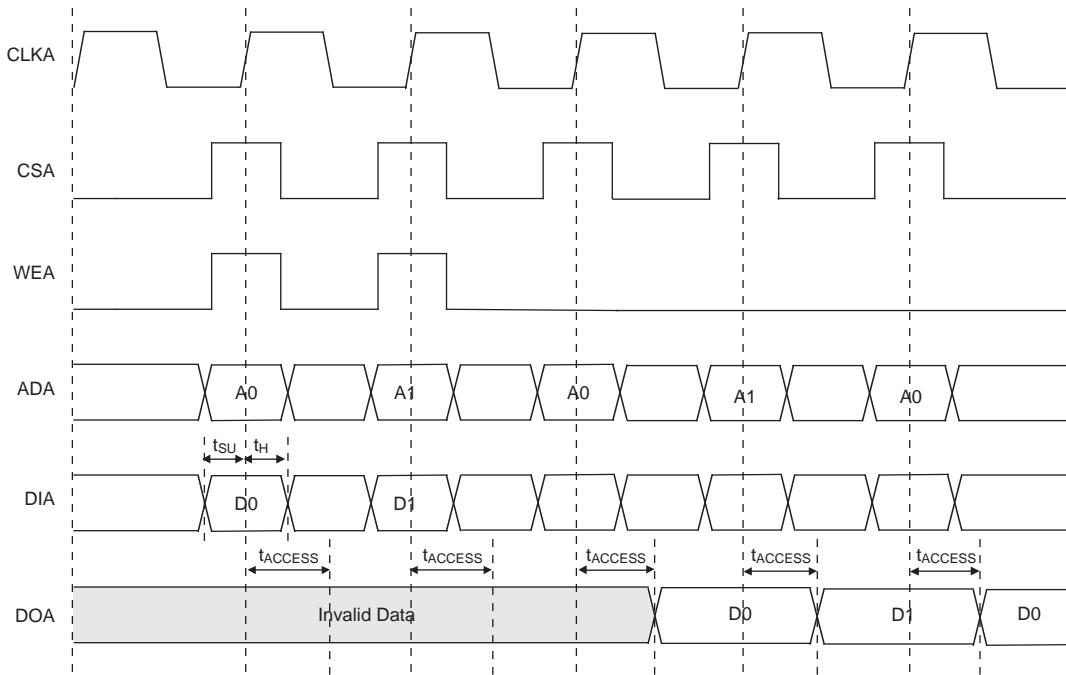

Details for the majority of the peripherals can be found in the associated technical documentation, see details at the end of this data sheet. Additional details of the MPI are provided below.

### **Microprocessor Interface (MPI)**

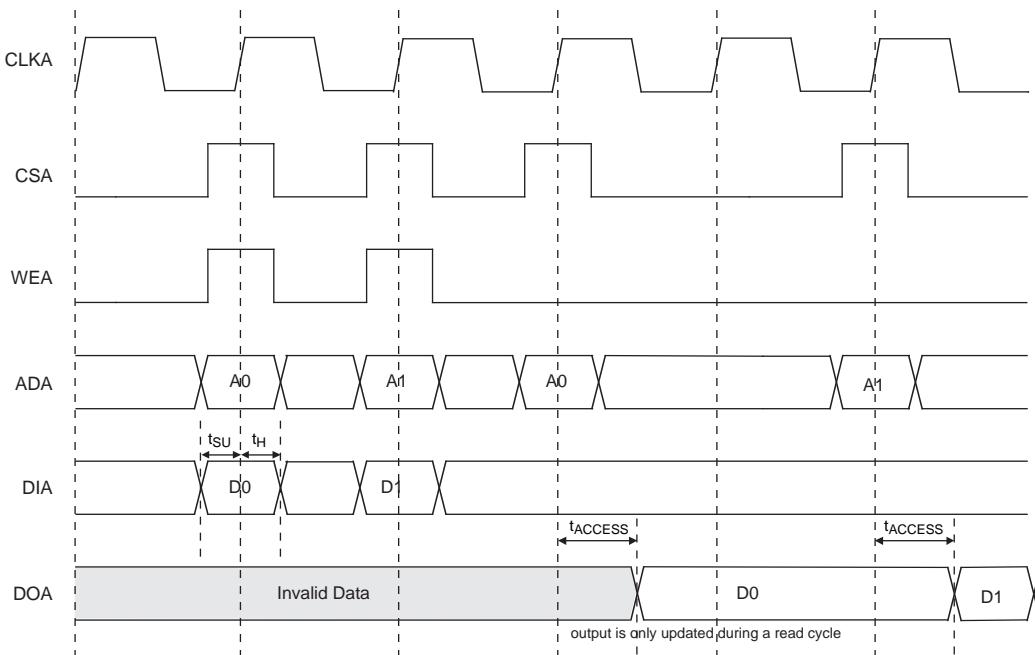

The LatticeSC family devices have a dedicated synchronous MPI function block. The MPI is programmable to operate with PowerPC/PowerQUICC MPC860/MPC8260 series microprocessors. The MPI implements an 8-, 16-, or 32-bit interface with 1-bit, 2-bit, or 4-bit parity to the host processor (PowerPC) that can be used for configuration and read-back of the FPGA as well as for user-defined data processing and general monitoring of FPGA functions.

The control portion of the MPI is available following power-up of the FPGA if the mode pins specify MPI mode, even if the FPGA is not yet configured. The width of the data port is selectable among 8-, 16-, or 32-bit and the parity bus can be 1-, 2-, or 4-bit. In configuration mode the data and parity bus width are related to the state of the M[0:3] mode pins. For post-configuration use, the MPI must be included in the configuration bit stream by using an MPI library element in your design from the ispLEVER primitive library, or by setting the bit of the MPI configuration control register prior to the start of configuration. The user can also enable and disable the parity bus through the configuration bit stream. These pads can be used as general I/O when they are not needed for MPI use.

The MPI block also provides the capability to interface directly to the FPGA fabric with a databus after configuration. The bus protocol is still handled by the MPI block but the direct FPGA access allows high-speed block data transfers such as DMA transactions. Figure 2-32 shows one of the ways a PowerPC is connected to MPI.

**EBR Memory Timing Diagrams****Figure 3-6. Read Mode**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive edge of the clock.

**Figure 3-7. Read Mode with Input Registers Only**

# LatticeSC/M Family Data Sheet

## Revision History

December 2011

Data Sheet DS1004

| Date          | Version | Section                          | Change Summary  |
|---------------|---------|----------------------------------|---|
| February 2006 | 01.0    | —                                | Initial release.  |
| March 2006    | 01.1    | Introduction                     | SC25 1020 I/O count changed to 476.   |
|               |         | Architecture                     | Changed ROM 16X4 to ROM 16X2.   |
|               |         |                                  | Changed "X2 or X4" to "DIV2 or DIV4".   |
|               |         |                                  | Added Global Set/Reset Section.   |
|               |         | DC and Switching Characteristics | Added notes 5 and 6 to Recommended Operating Conditions table.  |
|               |         |                                  | Added Power Supply Ramp Rates table.  |
|               |         |                                  | Removed -5 and -6 speed grades from Typical Building Block Performance table.   |
|               |         |                                  | Added Input Delay Timing table.   |
|               |         |                                  | Added Synchronous GSR Timing table.   |
|               |         | Pinout Information               | Expanded PROBE_VCC and PROBE_GND description.   |
|               |         |                                  | Removed A-RXREFCLKP_[L/R] from Signal Description table.  |
|               |         |                                  | Added RESP_[ULC/URC] to Signal Description table.   |
|               |         |                                  | Added notes 1 and 2 to Signal Description table.  |
|               |         |                                  | Changed number of NCs to 28.  |
|               |         |                                  | Changed number of SERDES (signal + power supply) to 74.   |
|               |         |                                  | Removed RESP balls from NC list (B2, C2, B29, C29).   |
|               |         |                                  | Added note to VTT table.  |
|               |         |                                  | Changed RxRefclk (B2 and C2) to NC.   |
|               |         |                                  | Added RESP_ULC.   |
|               |         |                                  | Added RESP_URC.   |
|               |         |                                  | Changed RxRefclk (B29 and C29) to NC.   |
| June 2006     | 01.2    | Introduction                     | Changed SERDES min bandwidth from 622 Mbps to 600 Mbps.   |
|               |         |                                  | Changed max SERDES bandwidth from 3.4 Gbps to 3.8 Gbps.   |
|               |         |                                  | Corrected number of package I/Os for the SC80 and SC115 1704 pin packages.  |
|               |         |                                  | Updated speed performance for typical functions with ispLEVER 6.0 values.   |
|               |         | Architecture                     | Changed "When these pins are not used they should be left unconnected." with "Unused VTT pins should be connected to GND if the internal or external VCMT function is not used in the bank. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float." |
|               |         |                                  | Added "SERDES Power Supply Sequencing Requirements" section.  |
|               |         |                                  | Changed total bandwidth per quad from 13.6 Gbps to 15.2 Gbps.   |
|               |         |                                  | Added the accuracy of the temperature-sensing diode to be typically +/- 10 °C. Also referred to a temperature-sensing diode application note for more information.  |
|               |         |                                  | Changed "CTAP" to "internal or external VCMT".  |
|               |         | DC and Switching Characteristics | Changed VCC12 parameter to include VDDP, VDDTX and VDDRX.   |
|               |         |                                  | Changed typical values to match ispLEVER 6.0 Power Calculator.  |
