Welcome to [E-XFL.COM](#)**Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	6250
Number of Logic Elements/Cells	25000
Total RAM Bits	1966080
Number of I/O	476
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1020-BBGA, FCBGA
Supplier Device Package	1020-OFCBGA (33x33)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga25e-6ffn1020i

this allows for easy integration with the rest of the system. These capabilities make the LatticeSC ideal for many multiple power supply and hot-swap applications. The maximum current during hot socketing is 4mA. See Hot Socketing Specifications in Chapter 3 of this data sheet.

Power-Up Requirements

To prevent high power supply and input pin currents, each VCC, VCC12, VCCAUX, VCCIO and VCCJ power supplies must have a monotonic ramp up time of 75 ms or less to reach its minimum operating voltage. Apart from VCC and VCC12, which have an additional requirement, and VCCIO and VCCAUX, which also have an additional requirement, the VCC, VCC12, VCCAUX, VCCIO and VCCJ power supplies can ramp up in any order, with no restriction on the time between them. However, the ramp time for each must be 75 ms or less. Configuration of the device will not proceed until the last power supply has reached its minimum operating voltage.

Additional Requirement for VCC and VCC12:

VCC12 must always be higher than VCC. This condition must be maintained at ALL times, including during power-up and power-down. Note that for 1.2V only operation, it is advisable to source both of these supplies from the same power supply.

Additional Requirement for VCCIO and VCCAUX:

If any VCCIOs are 1.2/1.5/1.8V, then VCCAUX MUST be applied before them. If any VCCIO is 1.2/1.5/1.8V and is powered up before VCCAUX, then when VCCAUX is powered up, it may drag VCCIO up with it as it crosses through the VCCIO value. (Note: If the VCCIO supply is capable of sinking current, as well as the more usual sourcing capability, this behavior is eliminated. However, the amount of current that the supply needs to sink is unknown and is likely to be in the hundreds of millamps range).

Power-Down Requirements

To prevent high power supply and input pin currents, power must be removed monotonically from either VCC or VCCAUX (and must reach the power-down trip point of 0.5V for VCC, 0.95V for VCCAUX) before power is removed monotonically from VCC12, any of the VCCIOs, or VCCJ. Note that VCC12 can be removed at the same time as VCC, but it cannot be removed earlier. In many applications, VCC and VCC12 will be sourced from the same power supply and so will be removed together. For systems where disturbance of the user pins is a don't care condition, the power supplies can be removed in any order as long as they power down monotonically within 200ms of each other.

Additionally, if any banks have VCCIO=3.3V nominal (potentially banks 1, 4, 5) then VCCIO for those banks must not be lower than VCCAUX during power-down. The normal variation in ramp-up times of power supplies and voltage regulators is not a concern here.

Note: The SERDES power supplies are NOT included in these requirements and have no specific sequencing requirements. However, when using the SERDES with VDDIB or VDDOB that is greater than 1.2V (1.5V nominal for example), the SERDES should not be left in a steady state condition with the 1.5V power applied and the 1.2V power not applied. Both the 1.2V and 1.5V power should be applied to the SERDES at nominally the same time. The normal variation in the ramp-up times of power supplies and voltage regulators is not a concern here.

SERDES Power Supply Sequencing Requirements

When using the SERDES with 1.5V VDDIB or VDDOB supplies, the SERDES should not be left in a steady state condition with the 1.5V power applied and the 1.2V power not applied. Both the 1.2V and the 1.5V power should be applied to the SERDES at nominally the same time. The normal variation in ramp-up times of power supplies and voltage regulators is not a concern.

Additional Requirement for SERDES Power Supply

All VCC12 pins need to be connected on all devices independent of functionality used on the device. This analog supply is used by both the RX and TX portions of the SERDES and is used to control the core SERDES logic regardless of the SERDES being used in the design. VDDIB and VDDOB are used as supplies for the terminations on the CML input and output buffers. If a particular channel is not used, these can be UNCONNECTED (floating).

- 8-bit SERDES Only
- 10-bit SERDES Only
- SONET (STS-12/STS-48)
- Gigabit Ethernet
- Fibre Channel
- XAUI
- Serial RapidIO
- PCI-Express
- Generic 8b10b

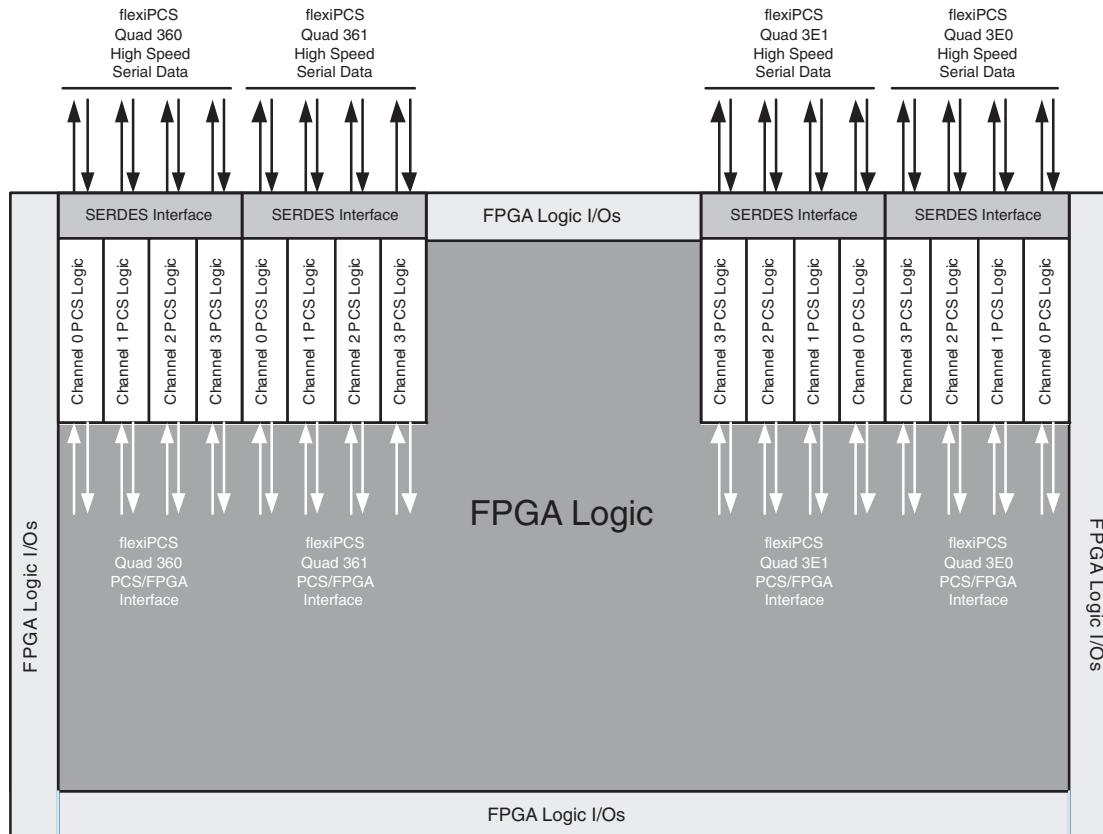

flexiPCS Quad

The flexiPCS logic is arranged in quads containing logic for four independent full-duplex data channels. Each device in the LatticeSC family has up to eight quads of flexiPCS logic. The LatticeSC Family Selection Guide table on the first page of this data sheet contains the number of flexiPCS channels present on the chip. Note that in some packages (particularly lower pin count packages), not all channels from all quads on a given device may be bonded to package pins.

Each quad supports up to four channels of full-duplex data and can be programmed into any one of several protocol based modes. Each quad requires its own reference clock which can be sourced externally or from the FPGA logic. The user can utilize between one and four channels in a quad, depending on the application.

Figure 2-30 shows an example of four flexiPCS quads in a LatticeSC device. Quads are labeled according to the address of their software controlled registers.

Figure 2-30. LatticeSC flexiPCS

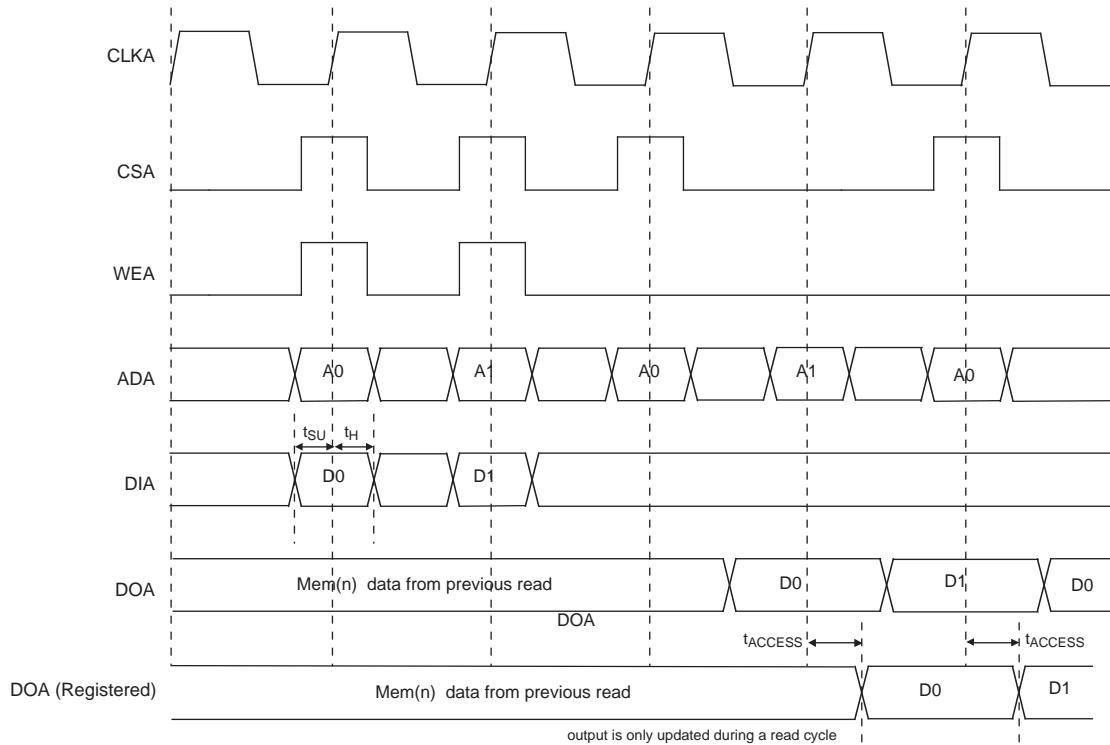

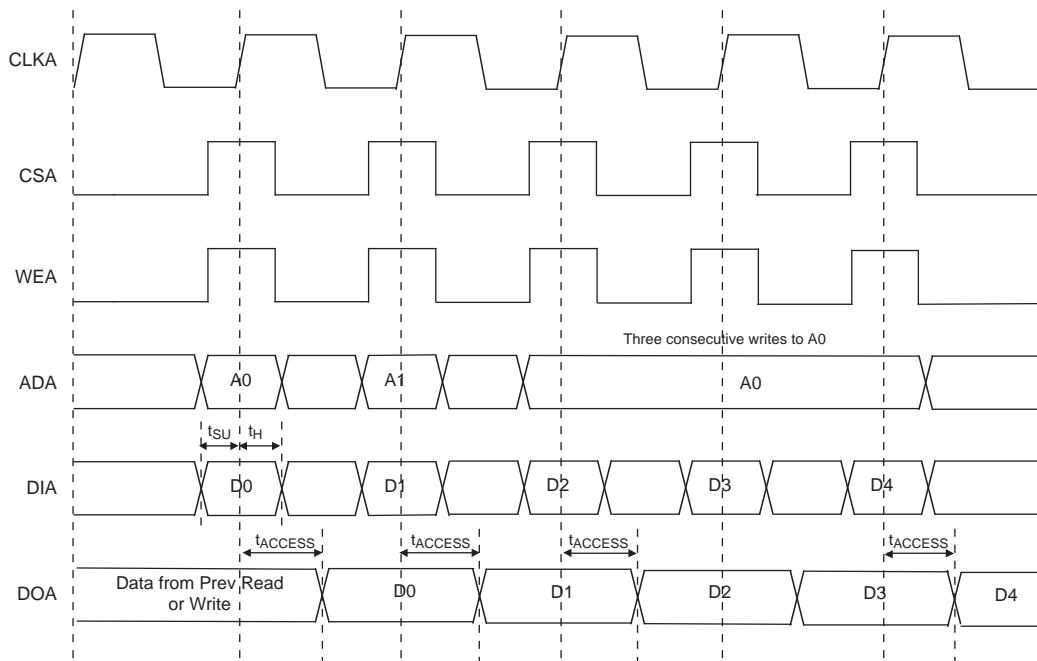

Since each quad has its own reference clock, different quads can support different standards on the same chip. This feature makes the LatticeSC family of devices ideal for bridging between different standards.

1. Differential pair grouping within a PIC is A (True) and B (Complement) and C (True) and D (Complement).

2. The LatticeSC/M25 and LatticeSC/M40 in a 1020-pin package support a 16-bit MPI interface.
