Welcome to **E-XFL.COM** 

# Understanding <u>Embedded - FPGAs (Field Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

#### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	10000
Number of Logic Elements/Cells	40000
Total RAM Bits	4075520
Number of I/O	562
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1020-BBGA, FCBGA
Supplier Device Package	1020-OFCBGA (33x33)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga40e-5ffn1020i

Email: info@E-XFL.COM

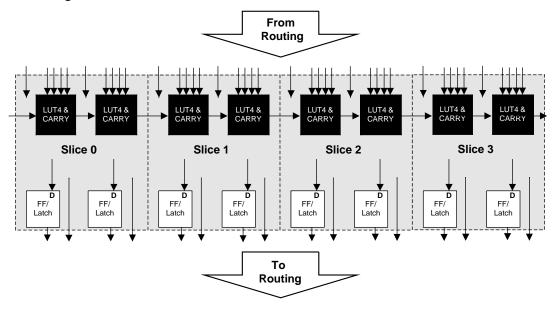

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

### **PFU Blocks**

The core of the LatticeSC devices consists of PFU blocks. The PFUs can be programmed to perform Logic, Arithmetic, Distributed RAM and Distributed ROM functions.

Each PFU block consists of four interconnected slices, numbered 0-3 as shown in Figure 2-2. All the interconnections to and from PFU blocks are from routing. There are 53 inputs and 25 outputs associated with each PFU block.

Figure 2-2. PFU Diagram

#### **Slice**

Each slice contains two LUT4 lookup tables feeding two registers (programmed to be in FF or Latch mode), and some associated logic that allows the LUTs to be combined to implement 5, 6, 7 and 8 Input LUTs (LUT5, LUT6, LUT7 and LUT8). There is control logic to perform set/reset functions (programmable as synchronous/asynchronous), clock select, chip-select and wider RAM/ROM functions. Figure 2-3 shows an overview of the internal logic of the slice. The registers in the slice can be configured for positive/negative and edge/level clocks.

There are 14 input signals: 13 signals from routing and one from the carry-chain (from adjacent slice or PFU). There are seven outputs: six to routing and one to carry-chain (to adjacent PFU). Table 2-1 lists the signals associated with each slice.

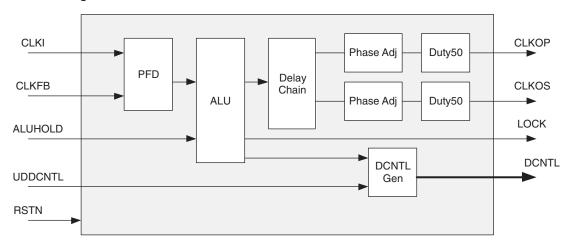

There is a Digital Control (DCNTL) bus available from the DLL block. This Digital Control bus is available to the delay lines in the PIC blocks in the adjacent banks. The UDDCNTL signal allows the user to latch the current value on the digital control bus.

Figure 2-12 shows the DLL block diagram of the DLL inputs and outputs. The output of the phase frequency detector controls an arithmetic logic unit (ALU) to add or subtract one delay tap. The digital output of this ALU is used to control the delay value of the delay chain and this digital code is transmitted via the DCNTL bus.

The sysCLOCK DLL can be configured at power-up, then, if desired, reconfigured dynamically through the Serial Memory Interface bus which interfaces with the on-chip Microprocessor Interface (MPI) bus. In addition, users can drive the SMI interface from routing if desired.

The user can configure the DLL for many common functions such as clock injection match and single delay cell. Lattice provides primitives in its design for time reference delay (DDR memory) and clock injection delay removal.

Figure 2-12. DLL Diagram

### **PLL/DLL Cascading**

The LatticeSC devices have been designed to allow certain combinations of PLL and DLL cascading. The allowable combinations are as follows:

- PLL to PLL
- PLL to DLL
- DLL to DLL
- DLL to PLL

DLLs are used to shift the clock in relation to the data for source synchronous inputs. PLLs are used for frequency synthesis and clock generation for source synchronous interfaces. Cascading PLL and DLL blocks allows applications to utilize the unique benefits of both DLL and PLLs.

When cascading the DLL to the PLL, the DLL can be used to drive the PLL to create fine phase shifts of an input clock signal. Figure 2-13 shows a shift of all outputs for CLKOP and CLKOS out in time.

Figure 2-13. DLL to PLL

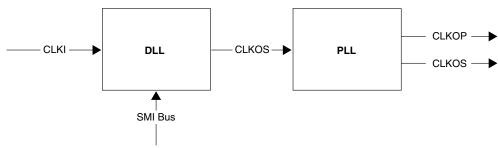

Figure 2-14 shows a shift of only CLKOP out in time.

Figure 2-14. PLL to DLL

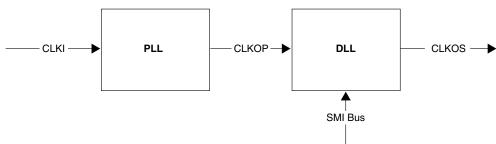

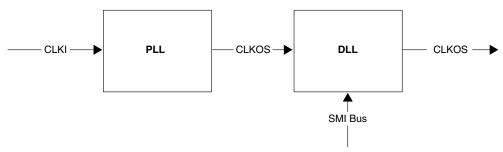

Figure 2-15 shows a shift of only CLKOS out in time.

#### Figure 2-15. PLL to DLL

For further information on the DLL, please see details of additional technical documentation at the end of this data sheet.

### sysMEM Memory Block

The sysMEM block can implement single port, true dual port, pseudo dual port or FIFO memories. Dedicated FIFO support logic allows the LatticeSC devices to efficiently implement FIFOs without consuming LUTs or routing resources for flag generation. Each block can be used in a variety of depths and widths as shown in Table 2-5. Memory with ranges from x1 to x18 in all modes: single port, pseudo-dual port and FIFO also providing x36.

Figure 2-26. LatticeSC Banks

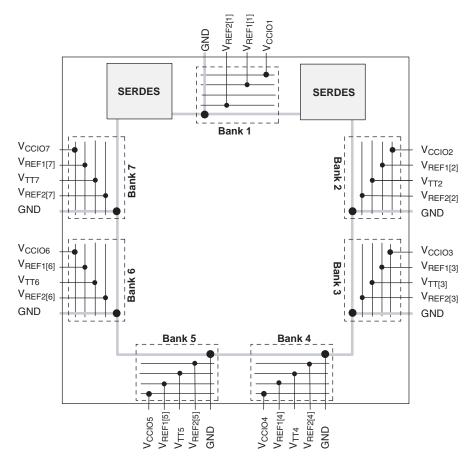

Table 2-7. Maximum Number of I/Os Per Bank in LatticeSC Family

Device	LFSC/M15	LFSC/M25	LFSC/M40	LFSC/M80	LFSC/M115
Bank1	104	80	136	80	136
Bank2	28	36	60	96	136
Bank3	60	84	96	132	156
Bank4	72	100	124	184	208
Bank5	72	100	124	184	208
Bank6	60	84	96	132	156
Bank7	28	36	60	96	136

Note: Not all the I/Os of the Banks are available in all the packages  $% \left( 1\right) =\left( 1\right) \left( 1$ 

The LatticeSC devices contain three types of PURESPEED I/O buffers:

#### 1. Left and Right Sides (Banks 2, 3, 6 and 7)

These buffers can support LVCMOS standards up to 2.5V. A differential output driver (for LVDS and RSDS) is provided on all primary PIO pairs (A and B) and differential receivers are available on all pairs. Complimentary drivers are available. Adaptive input logic is available on PIOs A or C.

#### 2. Top Side (Bank 1)

These buffers can support LVCMOS standards up to 3.3V, including PCI33, PCI-X33 and SSTL-33. Differential receivers are provided on all PIO pairs but differential drivers for LVDS and RSDS are not available. Adaptive input logic is not available on this side. Complimentary output drivers are available.

Table 2-10. Supported Output Standards4

Output Standard	Drive	V <sub>CCIO</sub> (Nom)	On-chip Output Termination
Single-ended Interfaces			,
LVTTL/D <sup>1</sup>	8mA, 16mA, 24mA	3.3	None.

RSDS	2mA, 3.5mA, 4mA, 6mA	N/A	None

<sup>1.</sup> D refers to open drain capability.

#### **PCI Clamp**

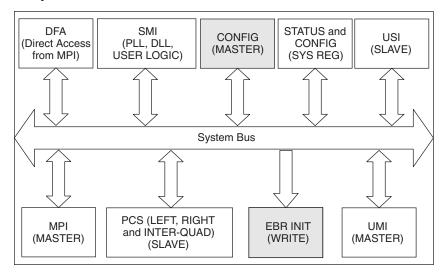

A programmable PCI clamp is available on the top and bottom banks of the device. The PCI clamp can be turned "ON" or "OFF" on each pin independently. The PCI clamp is used when implementing a 3.3V PCI interface. The

<sup>2.</sup> User can select either drive current or driver impedances but not both.

<sup>3.</sup> Emulated with external resistors.

<sup>4.</sup> No GTL or GTL+ support.

Figure 2-31. LatticeSC System Bus Interfaces

Several interfaces exist between the System Bus and other FPGA elements. The MPI interface acts as a bridge between the external microprocessor bus and System Bus. The MPI may work in an independent clock domain from the System Bus if the System Bus clock is not sourced from the external microprocessor clock. Pipelined operation allows high-speed memory interface to the EBR and peripheral access without the requirement for additional cycles on the bus. Burst transfers allow optimal use of the memory interface by giving advance information of the nature of the transfers.

Details for the majority of the peripherals can be found in the associated technical documentation, see details at the end of this data sheet. Additional details of the MPI are provided below.

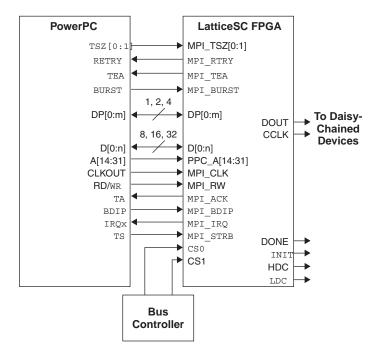

#### **Microprocessor Interface (MPI)**

The LatticeSC family devices have a dedicated synchronous MPI function block. The MPI is programmable to operate with PowerPC/PowerQUICC MPC860/MPC8260 series microprocessors. The MPI implements an 8-, 16-, or 32-bit interface with 1-bit, 2-bit, or 4-bit parity to the host processor (PowerPC) that can be used for configuration and read-back of the FPGA as well as for user-defined data processing and general monitoring of FPGA functions.

The control portion of the MPI is available following power-up of the FPGA if the mode pins specify MPI mode, even if the FPGA is not yet configured. The width of the data port is selectable among 8-, 16-, or 32-bit and the parity bus can be 1-, 2-, or 4-bit. In configuration mode the data and parity bus width are related to the state of the M[0:3] mode pins. For post-configuration use, the MPI must be included in the configuration bit stream by using an MPI library element in your design from the ispLEVER primitive library, or by setting the bit of the MPI configuration control register prior to the start of configuration. The user can also enable and disable the parity bus through the configuration bit stream. These pads can be used as general I/O when they are not needed for MPI use.

The MPI block also provides the capability to interface directly to the FPGA fabric with a databus after configuration. The bus protocol is still handled by the MPI block but the direct FPGA access allows high-speed block data transfers such as DMA transactions. Figure 2-32 shows one of the ways a PowerPC is connected to MPI.

Figure 2-32. PowerPCI and MPI Schematic

### **Configuration and Testing**

The following section describes the configuration and testing features of the LatticeSC family of devices.

#### IEEE 1149.1-Compliant Boundary Scan Testability

All LatticeSC devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port has its own supply voltage V<sub>CCJ</sub> and can operate with LVCMOS33, 25 and 18 standards. For additional detail refer to technical information at the end of the data sheet.

#### **Device Configuration**

All LatticeSC devices contain three possible ports that can be used for device configuration. The serial port, which supports bit-wide configuration, and the sysCONFIG port that supports both byte-wide and serial configuration. The MPI port supports 8-bit, 16-bit or 32-bit configuration.

The serial port supports both the IEEE Std. 1149.1 Boundary Scan specification and the IEEE Std. 1532 In-System Configuration specification. The sysCONFIG port is a 20-pin interface with six of the I/Os used as dedicated pins and the rest being dual-use pins. When sysCONFIG mode is not used, these dual-use pins are available for general purpose I/O. All I/Os for the sysCONFIG and MPI ports are in I/O bank #1.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port. Once a configuration port is selected, that port is locked and another configuration port cannot be activated until the next re-initialization sequence. For additional detail refer to technical information at the end of the data sheet.

#### Internal Logic Analyzer Capability (ispTRACY)

All LatticeSC devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time. For additional detail refer to technical information at the end of the data sheet.

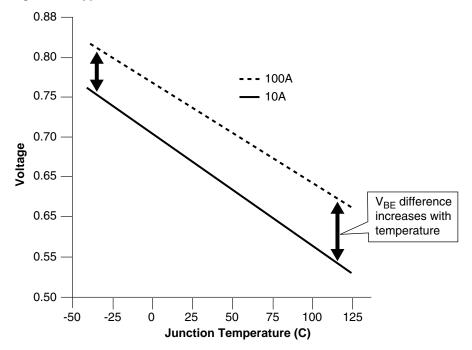

#### **Temperature Sensing**

Lattice provides a way to monitor the die temperature by using a temperature-sensing diode that is designed into every LatticeSC device. The difference in  $V_{BE}$  of the diode at two different forward currents varies with temperature. This relationship is shown in Figure 2-33. The accuracy of the temperature-sensing diode is typically +/- 10°C.

On packages that include PROBE\_GND, the most accurate measurements will occur between the TEMP pin and the PROBE\_GND pin. On packages that do not include PROBE\_GND, measurements should be made between the TEMP pin and board ground.

This temperature-sensing diode is designed to work with an external temperature sensor such as the Maxim 1617A. The Maxim 1617A is configured to measure difference in  $V_{BE}$  (of the temperature-sensing diode) at  $10\mu$ A and at  $100\mu$ A. This difference in  $V_{BE}$  voltage varies with temperature at approximately 1.64 mV/°C. A typical device with a 85°C junction temperature will measure approximately 593mV. For additional detail refer to TN1115, Temperature Sensing Diode in LatticeSC Devices.

Figure 2-33. Sensing Diode Typical Characteristics

#### **Oscillator**

Every LatticeSC device has an internal CMOS oscillator, which is used as a master serial clock for configuration and is also available as a potential general purpose clock (MCK) for the FPGA core. There is a K divider (divide by 2/4/8/16/32/64/128) available with this oscillator to get lower MCK frequencies. This clock is available as a general purpose clock signal to the software routing tool. For additional detail refer to technical information at the end of the data sheet.
