## Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

### Details

Product Status	Obsolete
Number of LABs/CLBs	10000
Number of Logic Elements/Cells	40000
Total RAM Bits	4075520
Number of I/O	604
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1152-BCBGA, FCBGA
Supplier Device Package	1152-CFCBGA (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga40e-6fc1152i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga40e-6fc1152i</a>

## Internal Logic Analyzer Capability (ispTRACY)

All LatticeSC devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time. For additional detail refer to technical information at the end of the data sheet.

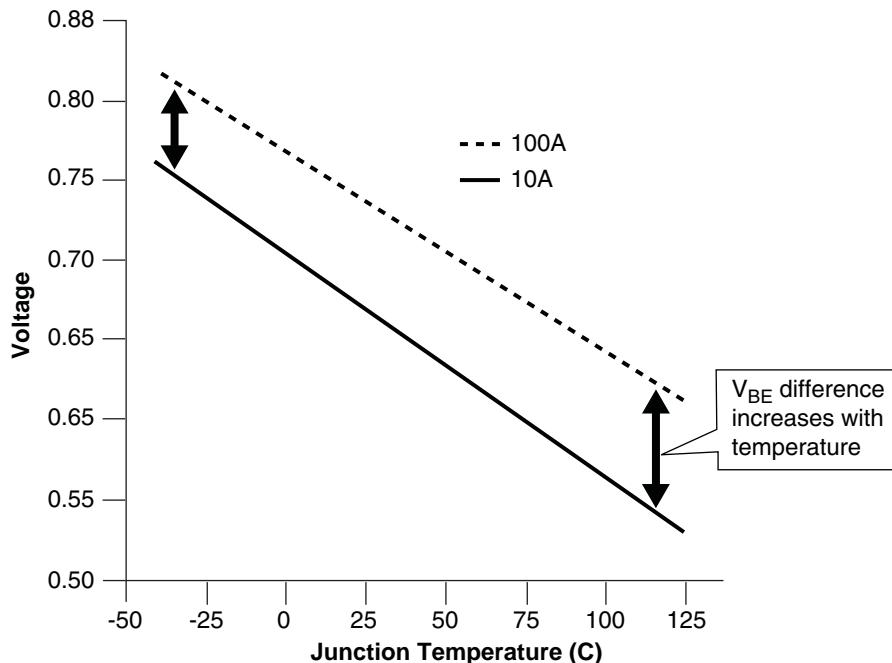

## Temperature Sensing

Lattice provides a way to monitor the die temperature by using a temperature-sensing diode that is designed into every LatticeSC device. The difference in  $V_{BE}$  of the diode at two different forward currents varies with temperature. This relationship is shown in Figure 2-33. The accuracy of the temperature-sensing diode is typically  $\pm 10^\circ\text{C}$ .

On packages that include PROBE\_GND, the most accurate measurements will occur between the TEMP pin and the PROBE\_GND pin. On packages that do not include PROBE\_GND, measurements should be made between the TEMP pin and board ground.

This temperature-sensing diode is designed to work with an external temperature sensor such as the Maxim 1617A. The Maxim 1617A is configured to measure difference in  $V_{BE}$  (of the temperature-sensing diode) at  $10\mu\text{A}$  and at  $100\mu\text{A}$ . This difference in  $V_{BE}$  voltage varies with temperature at approximately  $1.64 \text{ mV}/^\circ\text{C}$ . A typical device with a  $85^\circ\text{C}$  junction temperature will measure approximately 593mV. For additional detail refer to TN1115, [Temperature Sensing Diode in LatticeSC Devices](#).

**Figure 2-33. Sensing Diode Typical Characteristics**

## Oscillator

Every LatticeSC device has an internal CMOS oscillator, which is used as a master serial clock for configuration and is also available as a potential general purpose clock (MCK) for the FPGA core. There is a K divider (divide by 2/4/8/16/32/64/128) available with this oscillator to get lower MCK frequencies. This clock is available as a general purpose clock signal to the software routing tool. For additional detail refer to technical information at the end of the data sheet.

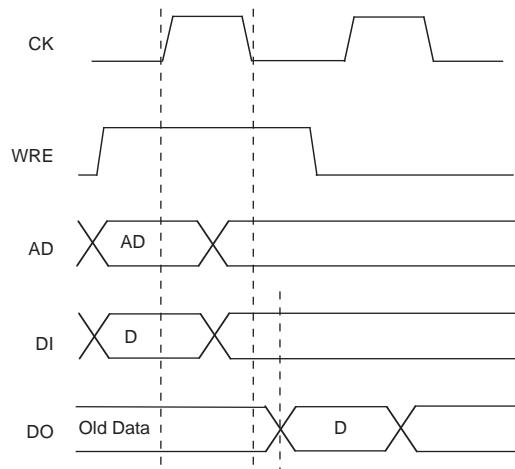

## Density Shifting

The LatticeSC family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

## Timing Diagrams

### PFU Timing Diagrams

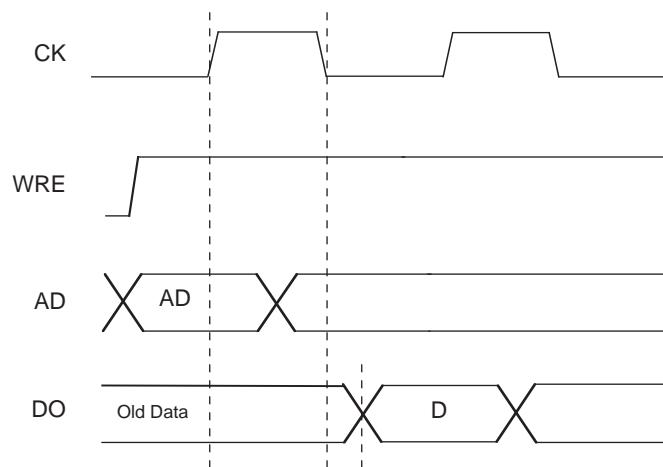

Figure 3-4. Slice Single/Dual Port Write Cycle Timing

Notes:

- Rising Edge for latching WREN, WAD and DATAIN.
- WREN must continue past falling edge clock.
- Data output occurs on negative edge.

Figure 3-5. Slice Single/Dual Port Read Cycle Timing

**Signal Descriptions (Cont.)**

Signal Name	I/O	Description
MPI_STRBN	I	Driven active low indicates the start of a transaction on the PowerPC bus. MPI will strobe the address bus at next rising edge of clock.
MPI_ADDR[31:14]	I	Address bus driven by a PowerPC bus master. Only 18-bit width is needed. It has to be the least significant bit of the PowerPC 32-bit address A[31:14].
MPI_DAT[n:0]	I/O	Selectable data bus width from 8, and 16-bit. Driven by a bus master in a write transaction. Driven by MPI in a read transaction.
MPI_PAR[m:0]	I/O	Selectable parity bus width from 1, 2, and 3-bit. MPI_DP[0] for MPI_D[7:0], MPI_DP[1] for MPI_D[15:8] and MPI_DP[2] for MPI_D[23:16].
MPI_TA	O	Transfer acknowledge. Driven active low indicates that MPI received the data on the write cycle or returned data on the read cycle.
MPI_TEA	O	Transfer Error Acknowledge. Driven active low indicates that MPI detects a bus error on the internal system bus for current transaction.
MPI_RETRY	O	Active low MPI Retry requests the MPC860 to relinquish the bus and retry the cycle.
<b>Multi-chip Alignment (User I/O if not used.)</b>		
MCA_DONE_OUT	O	Multi-chip alignment done output (to second MCA chip)
MCA_DONE_IN	I	Multi-chip alignment done input (from second MCA chip)
MCA_CLK_P[1:2]_OUT	O	Multi-chip alignment clock [1:2] output (sourced by MCA master chip)
MCA_CLK_P[1:2]_IN	I	Multi-chip alignment clock [1:2] input (from MCA master chip)
TEMP	—	Temperature sensing diode pin. Dedicated pin. Accuracy is typically +/- 10°C.
<b>Miscellaneous Dedicated Pins</b>		
XRES	—	External reference resistor between this pin and ground. The reference resistor is used to calibrate the programmable terminating resistors used in the I/Os. Dedicated pin. Value: 1K ± 1% ohm.
DIFFRx	—	Only used if a differential driver is used in a bank. This DIFFRx must be connected to ground via an external 1K ±1% ohm resistor for all banks that have a differential driver.
<b>SERDES Block (Dedicated Pins)</b>		
[A:D]_HDINPx_[L/R]	I	High-speed input (positive) channel x on left [L] or right [R] side of device. PCS quad is defined in the dual function name column of the Logic Signal Connection table.
[A:D]_HDINNx_[L/R]	I	High-speed input (negative) channel x on left [L] or right [R] side of device. PCS quad is defined in the dual function name column of the Logic Signal Connection table.
[A:D]_HDOUTPx_[L/R]	O	High-speed output (positive) channel x on left [L] or right [R] side of device. PCS quad is defined in the dual function name column of the Logic Signal Connection table.
[A:D]_HDOUTNx_[L/R]	O	High-speed output (negative) channel x on left [L] or right [R] side of device. PCS quad is defined in the dual function name column of the Logic Signal Connection table.
[A:D]_REFCLKP_[L/R]	I	Ref clock input (positive), aux channel on left [L] or right [R] side of device.
[A:D]_REFCLKN_[L/R]	I	Ref clock input (negative), aux channel on left [L] or right [R] side of device.
