Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	10000
Number of Logic Elements/Cells	40000
Total RAM Bits	4075520
Number of I/O	562
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1020-BBGA, FCBGA
Supplier Device Package	1020-OFcBGA Rev 2 (33x33)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga40e-6ffa1020c

Figure 2-1. Simplified Block Diagram (Top Level)

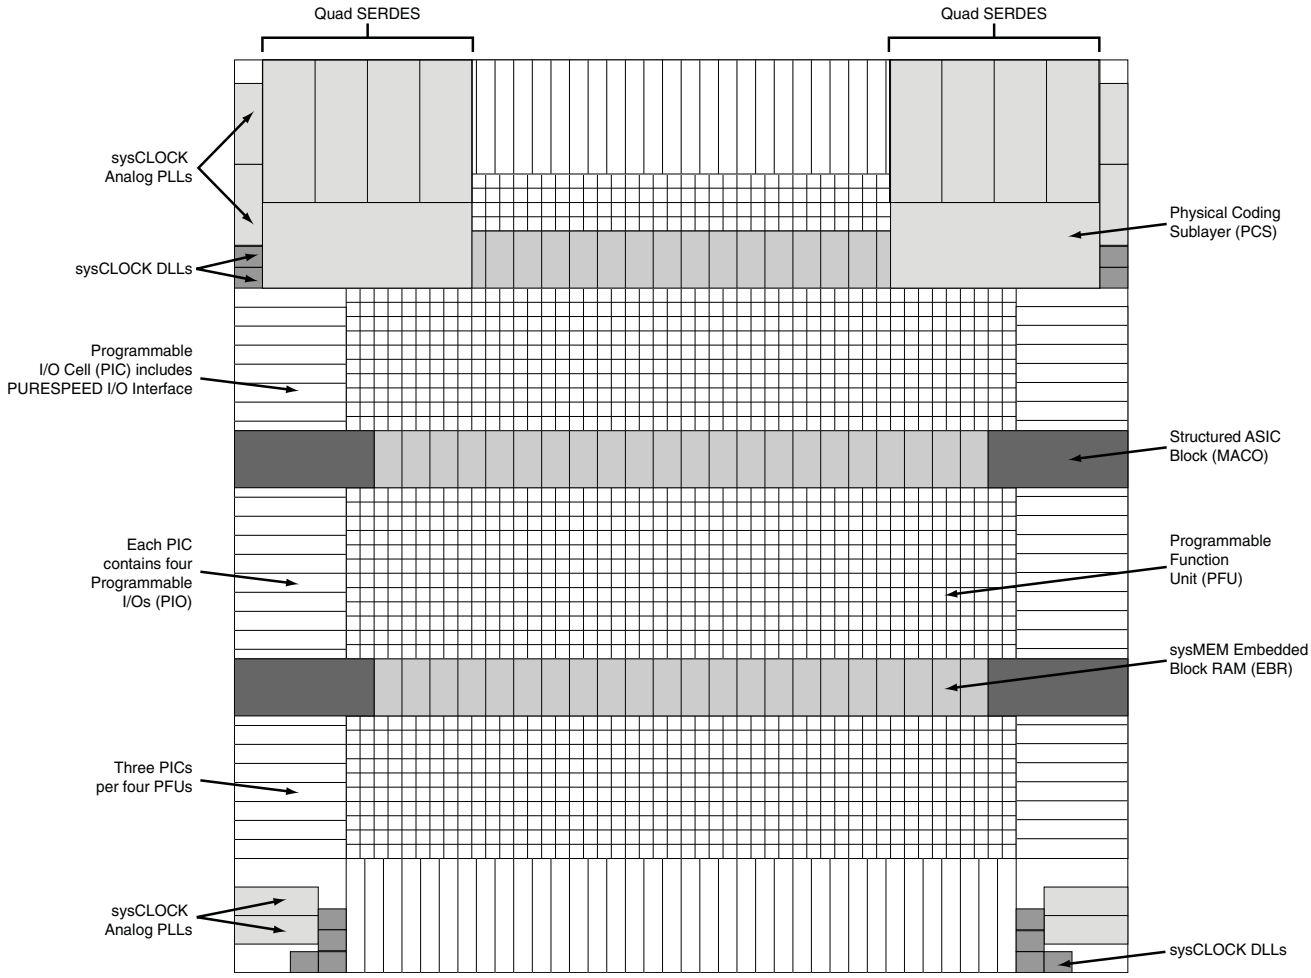

Figure 2-21. Input DDR/Shift Register Block

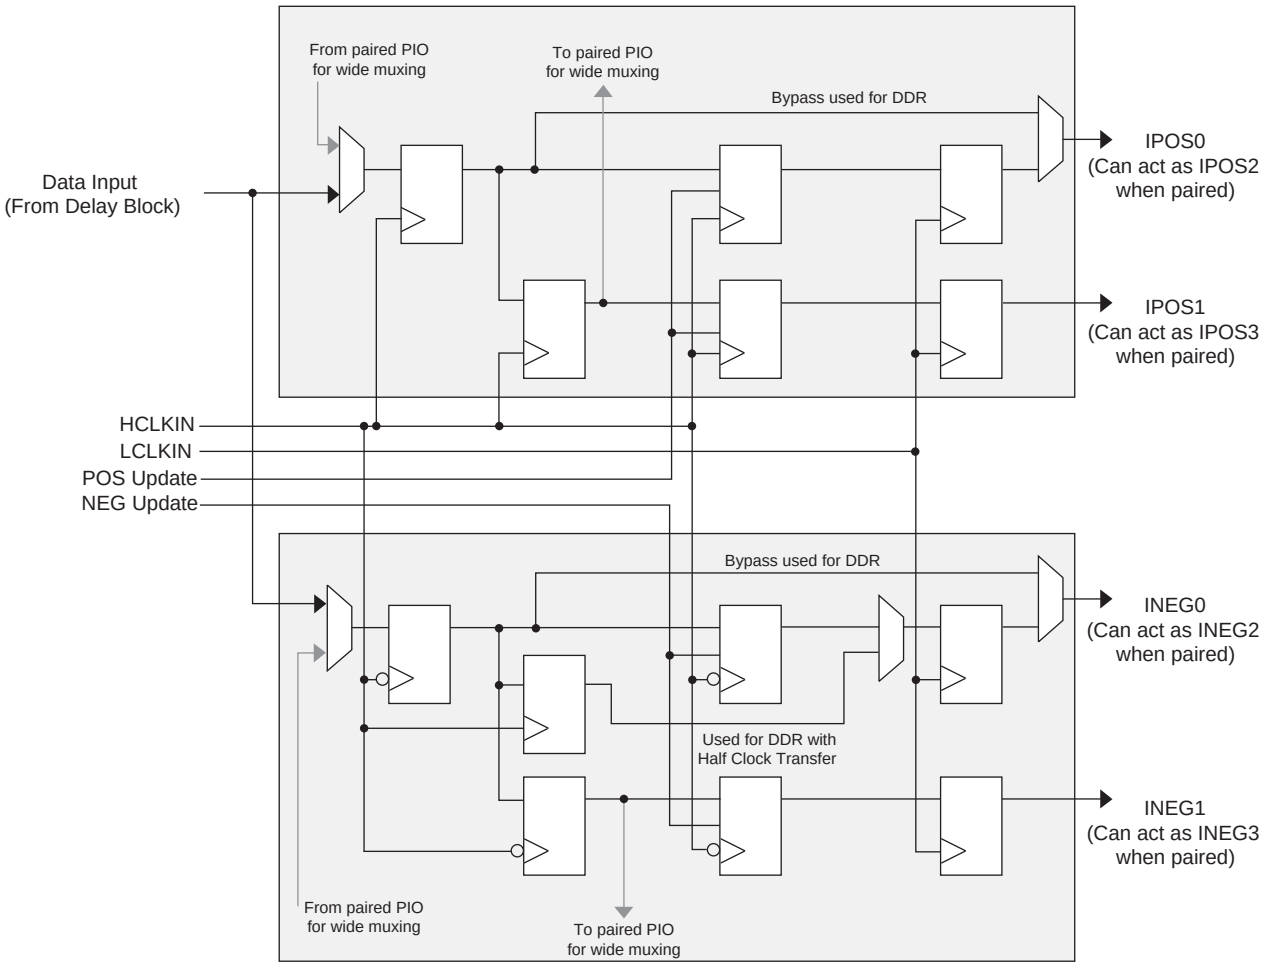


Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the PURESPEED I/O buffers. The block contains a register for SDR operation and a group of registers for DDR and shift register operation. The output signal (DO) can be derived directly from one of the inputs (bypass mode), the SDR register or the DDR/shift register block. Figure 2-22 shows the diagram of the Output Register Block.

Output SDR Register/Latch Block

The SDR register operates on the positive edge of the high-speed clock. It has clock enable that is driven by the clock enable output signal generated by the control MUX. In addition it has a variety of programmable options for set/reset including, set or reset, asynchronous or synchronous Local Set Reset LSR (LSR has precedence over CE) and Global Set Reset GSR enable or disable. The register LSR input is driven from LSRO, which is generated from the PIO control MUX. The GSR inputs is driven from the GSR output of the PIO control MUX, which allows the global set-reset to be disabled on a PIO basis.

Output DDR/Shift Block

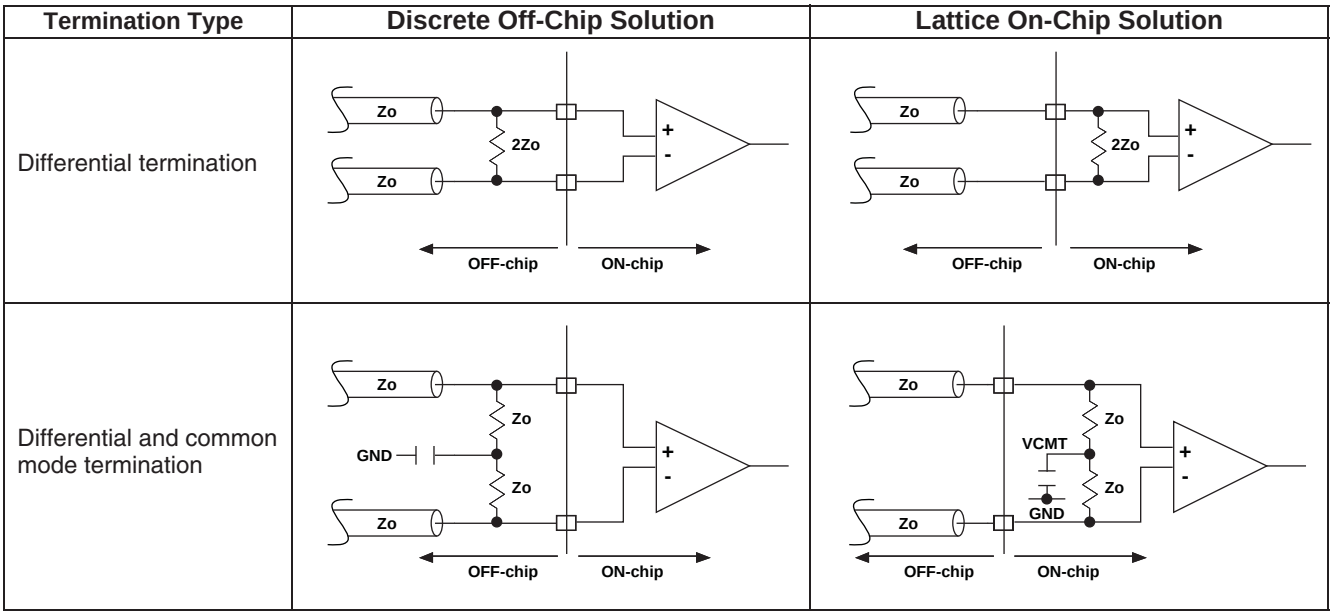
The DDR/Shift block contains registers and associated logic that support DDR and shift register functions using the high-speed clock and the associated transfer from the low-speed clock domain. It functions as a gearbox allowing low-speed parallel data from the FPGA fabric be output as a higher speed serial stream. Each PIO supports DDR and x2 shift functions. If desired PIOs A and B or C and D can be combined to form x4 shift functions. Figure 2-22 shows a simplified block diagram of the shift register block.

Differential Input Termination

The LatticeSC device allows two types of differential termination. The first is a single resistor across the differential inputs. The second is a center-tapped system where each input is terminated to the on-chip termination bus V_{CMT}. The V_{CMT} bus is DC-coupled through an internal capacitor to ground.

Figure 2-29 shows the differential termination schemes and Table 2-9 shows the nominal values of the termination resistors.

Figure 2-29. Differential Termination Scheme



Calibration

There are two calibration sources that are associated with the termination scheme used in the LatticeSC devices:

- DIFFR – This pin occurs in each bank that supports differential drivers and must be connected through a 1K+/-1% resistor to ground if differential outputs are used. Note that differential drivers are not supported in banks 1, 4 and 5.
- XRES – There is one of these pins per device. It is used for several functions including calibrating on-chip termination. This pin should always be connected through a 1K+/-1% resistor to ground.

The LatticeSC devices support two modes of calibration:

- Continuous – In this mode the SC devices continually calibrate the termination resistances. Calibration happens several times a second. Using this mode ensures that termination resistances remain calibrated as the silicon junction temperature changes.
- User Request – In this mode the calibration circuit operates continuously. However, the termination resistor values are only updated on the assertion of the calibration_update signal available to the core logic.

For more information on calibration, refer to the details of additional technical documentation at the end of this data sheet.

Hot Socketing

The LatticeSC devices have been carefully designed to ensure predictable behavior during power-up and power-down. To ensure proper power sequencing, care must be taken during power-up and power-down as described below. During power-up and power-down sequences, the I/Os remain in tristate until the power supply voltage is high enough to ensure reliable operation. In addition, leakage into I/O pins is controlled to within specified limits,

LatticeSC/M Internal Timing Parameters[1] (Continued)

Over Recommended Commercial Operating Conditions at VCC = 1.2V +/- 5%

Parameter	Symbol	Description	-7		-6		-5		Units
			Min.	Max.	Min.	Max.	Min.	Max.	
EBR Timing									
t_{CO_EBR}	CK_Q_DEL	Clock (Read) to output from Address or Data	—	1.900	—	2.116	—	2.335	ns
t_{COO_EBR}	CK_Q_DEL	Clock (Write) to output from EBR output Register	0.390	—	0.444	—	0.498	—	ns
t_{SUDATA_EBR}	D_CK_SET	Setup Data to EBR Memory (Write clk)	-0.173	—	-0.192	—	-0.210	—	ns
t_{HDATA_EBR}	D_CK_HLD	Hold Data to EBR Memory (Write clk)	0.276	—	0.305	—	0.335	—	ns
t_{SUADDR_EBR}	A_CK_SET	Setup Address to EBR Memory (Write clk)	-0.165	—	-0.182	—	-0.200	—	ns
t_{HADDR_EBR}	A_CK_HLD	Hold Address to EBR Memory (Write clk)	0.269	—	0.298	—	0.327	—	ns
t_{SUWREN_EBR}	CE_CK_SET	Setup Write/Read Enable to EBR Memory (Write/Read clk)	0.225	—	0.226	—	0.226	—	ns
t_{HWREN_EBR}	CE_CK_HLD	Hold Write/Read Enable to EBR Memory (write/read clk)	0.073	—	0.095	—	0.116	—	ns
t_{SUCE_EBR}	CS_CK_SET	Clock Enable Setup Time to EBR Output Register (Read clk)	0.261	—	0.269	—	0.276	—	ns
t_{HCE_EBR}	CS_CK_HLD	Clock Enable Hold Time to EBR Output Register (Read clk)	0.023	—	0.039	—	0.055	—	ns
t_{RSTO_EBR}	RESET_Q_DEL	Reset To Output Delay Time from EBR Output Register (asynchronous)	—	0.589	—	0.673	—	0.757	ns
Cycle Boosting Timing									
t_{DEL1}	DEL1	Cycle boosting delay 1 applies to PIO, PFU, EBR	—	0.480	—	0.524	—	0.570	ns
t_{DEL2}	DEL2	Cycle boosting delay 2 applies to PIO, PFU, EBR	—	0.922	—	1.005	—	1.090	ns
t_{DEL3}	DEL3	Cycle boosting delay 3 applies to PIO, PFU, EBR	—	1.366	—	1.488	—	1.612	ns

1. Complete timing parameters for a user design will be incorporated when running ispLEVER. This is a sampling of the key timing parameters.

Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Designers must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the Thermal Management document to find the device/package specific thermal values.

For Further Information

For further information regarding Thermal Management, refer to the following located on the Lattice website at www.latticesemi.com.

- Thermal Management document
- Technical Note TN1101 - Power Estimation and Management for LatticeSC Devices
- Power Calculator tool included with Lattice's ispLEVER design tool, or as a standalone download from www.latticesemi.com/software

1. Converted to organic flip-chip BGA package per PCN #01A-10.

Date	Version	Section	Change Summary
June 2006 (cont.)	01.2 (cont.)	DC and Switching Characteristics (cont.)	Updated Typical Building Block Performance with ispLEVER 6.0 values.
			Updated LatticeSC External Switching Characteristics with ispLEVER 6.0 values.
			Updated Lattice SC Internal Timing Parameters with ispLEVER 6.0 values.
			Updated Lattice SC Family Timing Adders with ispLEVER 6.0 values
			Changed % spread from 1 to 0.5 min and from 3 to 1.5 max.
			Changed conditions to refer to “with multiplication” and “without multiplication”.
			Changed the formula for t_{OPJIT} with multiplication (same result, different representation).
		Pinout Information	Expanded definition of NC.
			Expanded definition of GND.
			Expanded definition of VTT_x.
			Expanded definition of VCC12.
			Added accuracy of TEMP pin.
			Added RESPN_[ULC/URC].
			Updated Pin Information Summary with additional devices and packages.
			Added additional devices and packages pinouts.
			Removed Power Supply and NC connections table
			Removed VTT table
			Removed LFSC25 Logic Signal Connections: 900-Ball ffBGA1 table
			Changed all VDDP, VDDTX and VDDRX to VCC12.
		Ordering Information	Added dual marking.
			Added lead free packaging information to part number description.
August 2006	01.3	Introduction	Added SC40 1152 information to Table 1-1.
			Updated Table 1-3 with ispLEVER 6.0 SP1 results.
		Architecture	Added SSTL18 II to Table 2-8.
			Changed Table 2-10 VCCIO column to “N/A” for LVDS, mini-LVDS, BLVDS25, MLVDS25, HYPT and RSDS.
			Changed Hypertransport performance to 700 MHz (1400 Mbps) in Table 2-11.
			Changed SPI4.2 performance to 500 MHz (1000 Mbps) in Table 2-11
			Added “On packages that include PROBE_GND, the most accurate measurements will occur between the TEMP pin and the PROBE_GND pin. On packages that do not include PROBE_GND, measurements should be made between the TEMP pin and board ground.”
			Added VCCIO of 2.5 V for LVPECL33 in table 2-9.
		DC and Switching Characteristics	Updated Typical Building Block Performance with ispLEVER 6.0 SP1 results.
			Updated Initialization and Standby Supply Current table to break out ICC and ICC12.
			Updated LatticeSC External Switching Characteristics with ispLEVER 6.0 SP1 results.
			Updated LatticeSC Internal Timing Parameters with ispLEVER 6.0 SP1 results.
