Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

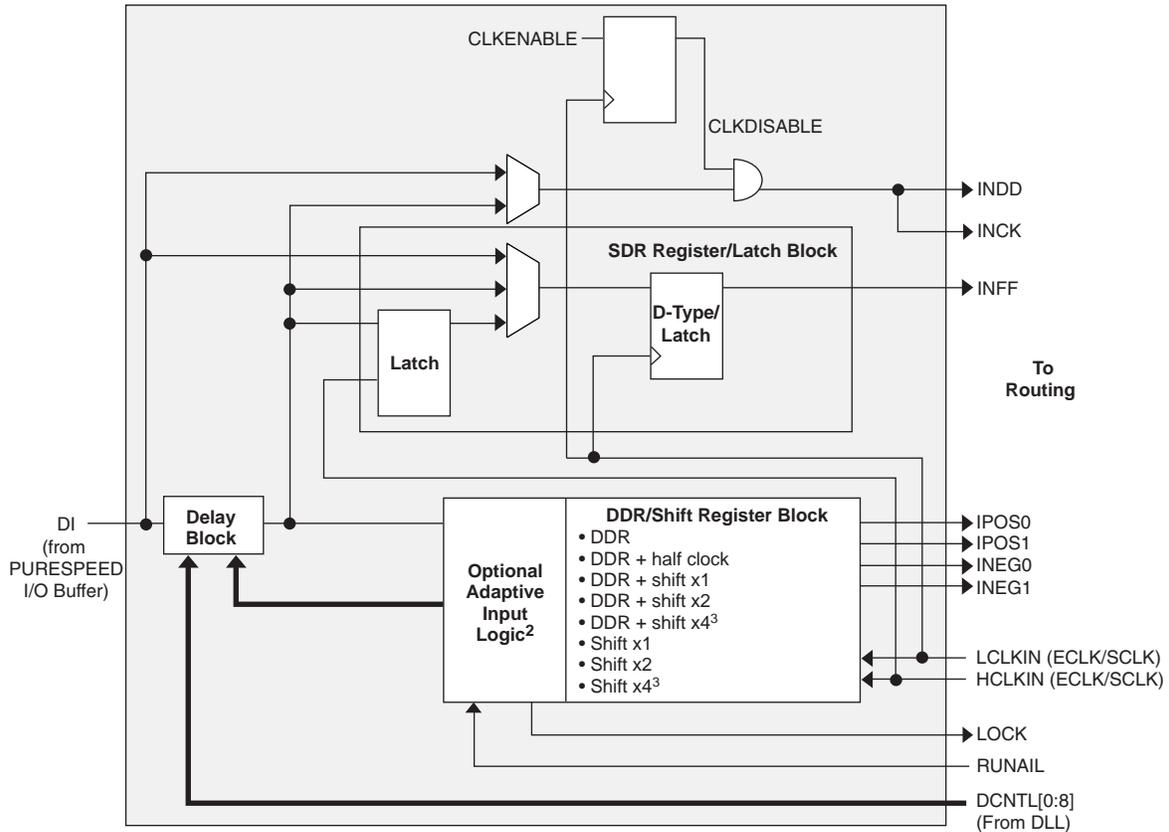

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

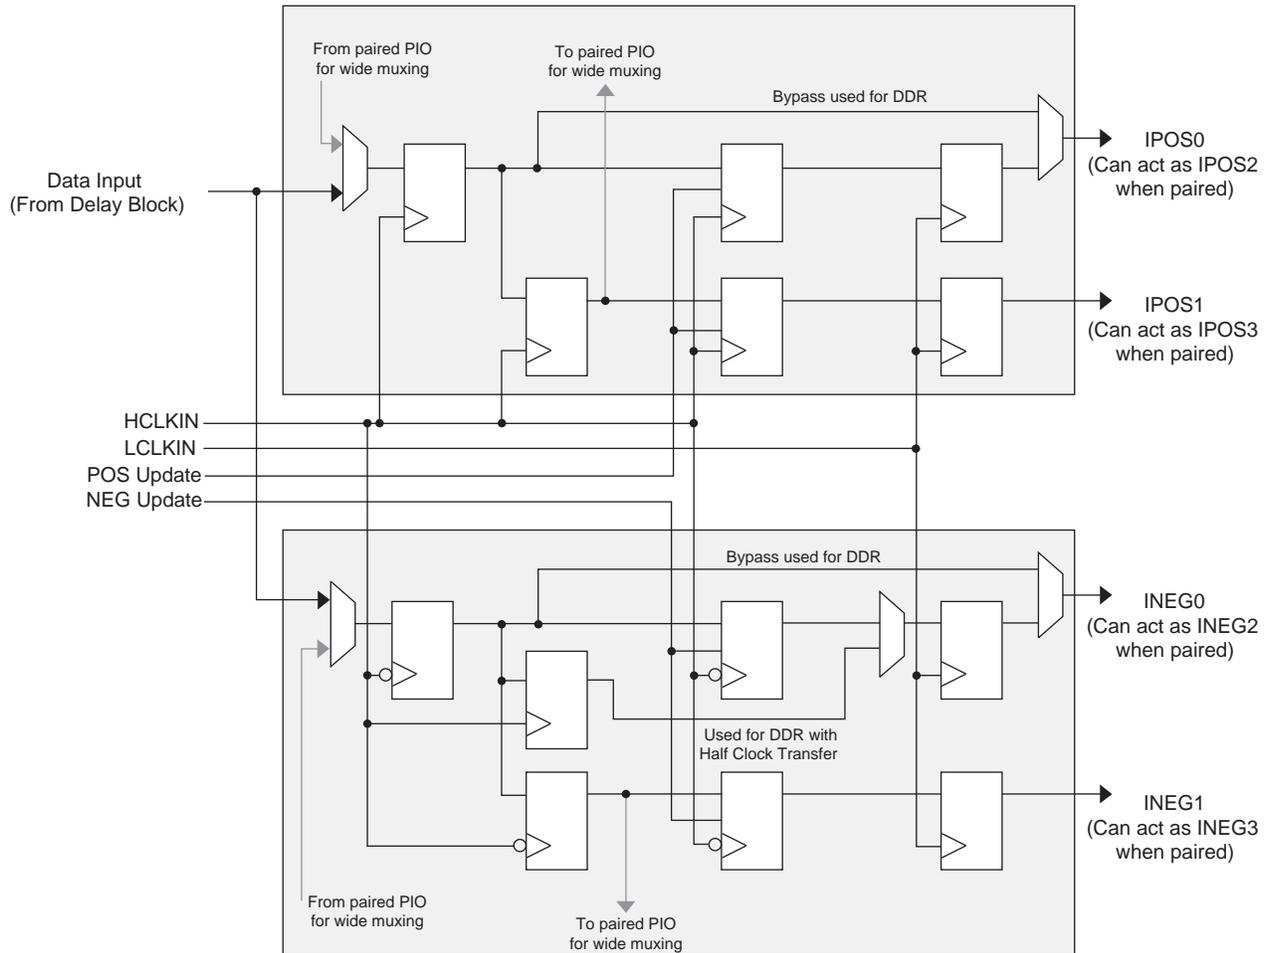

Product Status	Obsolete
Number of LABs/CLBs	20000
Number of Logic Elements/Cells	80000
Total RAM Bits	5816320
Number of I/O	660
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1152-BBGA
Supplier Device Package	1152-FPBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfsc3ga80e-5ffn1152i

Figure 2-20. Input Register Block¹

1. UPDATE, Set and Reset not shown for clarity
2. Adaptive input logic is only available in selected PIO
3. By four shift modes utilize DDR/shift register block from paired PIO.
4. CLKDISABLE is used to block the transitions on the DQS pin during post-amble. Its main use is to disable DQS (typically found in DDR memory interfaces) or other clock signals. It can also be used to disable any/all input signals to save power.

Figure 2-21. Input DDR/Shift Register Block

Output Register Block

The output register block provides the ability to register signals from the core of the device before they are passed to the PURESPEED I/O buffers. The block contains a register for SDR operation and a group of registers for DDR and shift register operation. The output signal (DO) can be derived directly from one of the inputs (bypass mode), the SDR register or the DDR/shift register block. Figure 2-22 shows the diagram of the Output Register Block.

Output SDR Register/Latch Block

The SDR register operates on the positive edge of the high-speed clock. It has clock enable that is driven by the clock enable output signal generated by the control MUX. In addition it has a variety of programmable options for set/reset including, set or reset, asynchronous or synchronous Local Set Reset LSR (LSR has precedence over CE) and Global Set Reset GSR enable or disable. The register LSR input is driven from LSRO, which is generated from the PIO control MUX. The GSR inputs is driven from the GSR output of the PIO control MUX, which allows the global set-reset to be disabled on a PIO basis.

Output DDR/Shift Block

The DDR/Shift block contains registers and associated logic that support DDR and shift register functions using the high-speed clock and the associated transfer from the low-speed clock domain. It functions as a gearbox allowing low-speed parallel data from the FPGA fabric be output as a higher speed serial stream. Each PIO supports DDR and x2 shift functions. If desired PIOs A and B or C and D can be combined to form x4 shift functions. Figure 2-22 shows a simplified block diagram of the shift register block.

Table 2-6. Input/Output/Tristate Gearing Resource Rules

PIO	Input/Output Logic			Tri-State/Bidi	
	x1	x2	x4	x1	x2/x4
A	?	?	?	?	N/A
B	?	No I/O Logic	No I/O Logic	?	N/A
C	?	?	No I/O Logic	?	N/A
D	?	No I/O Logic	No I/O Logic	?	N/A

Note: Pin can still be used without I/O logic.

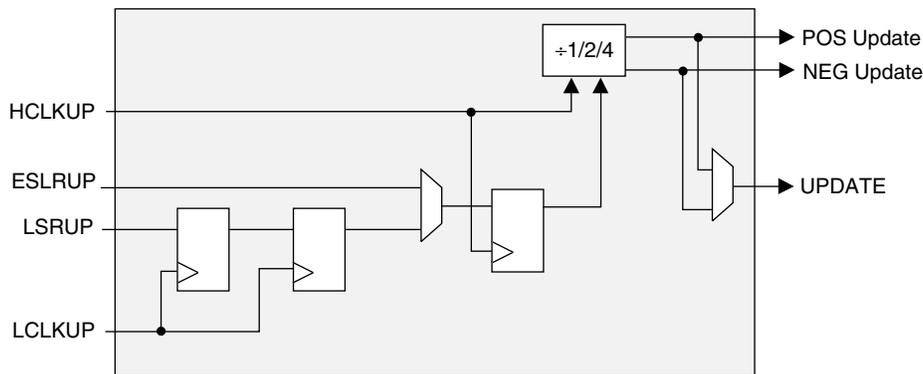

Control Logic Block

The control logic block allows the modification of control signals selected by the routing before they are used in the PIO. It can optionally invert all signals passing through it except the Global Set/Reset. Global Set/Reset can be enabled or disabled. It can route either the edge clock or the clock to the high-speed clock nets. The clock provided to the PIO by routing is used as the slow-speed clocks. In addition this block contains delays that can be inserted in the clock nets to enable Lattice’s unique cycle boosting capability.

Update Block

The update block is used to generate the POS update and NEG update signals used by the DDR/Shift register blocks within the PIO. Note the update block is only required in shift modes. This is required in order to do the high speed to low speed handoff. One of these update signals is also selected and output from the PIC as the signal UPDATE. It consists of a shift chain that operates off either the high-speed input or output clock. The values of each register in the chain are set or reset depending on the desired mode of operation. The set/reset signal is generated from either the edge reset ELSR or the local reset LSR. These signals are optionally inverted by the Control Logic Block and provided to the update block as ELSRUP and LSRUP. The Lattice design tools automatically configure and connect the update block when one of the DDR or shift register primitives is used.

Figure 2-25. Update Block

PURESPEED I/O Buffer

Each I/O is associated with a flexible buffer referred to as PURESPEED I/O buffer. These buffers are arranged around the periphery of the device in seven groups referred to as Banks. The PURESPEED I/O buffers allow users to implement the wide variety of standards that are found in today’s systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL. The availability of programmable on-chip termination for both input and output use, further enhances the utility of these buffers.

Figure 2-26. LatticeSC Banks

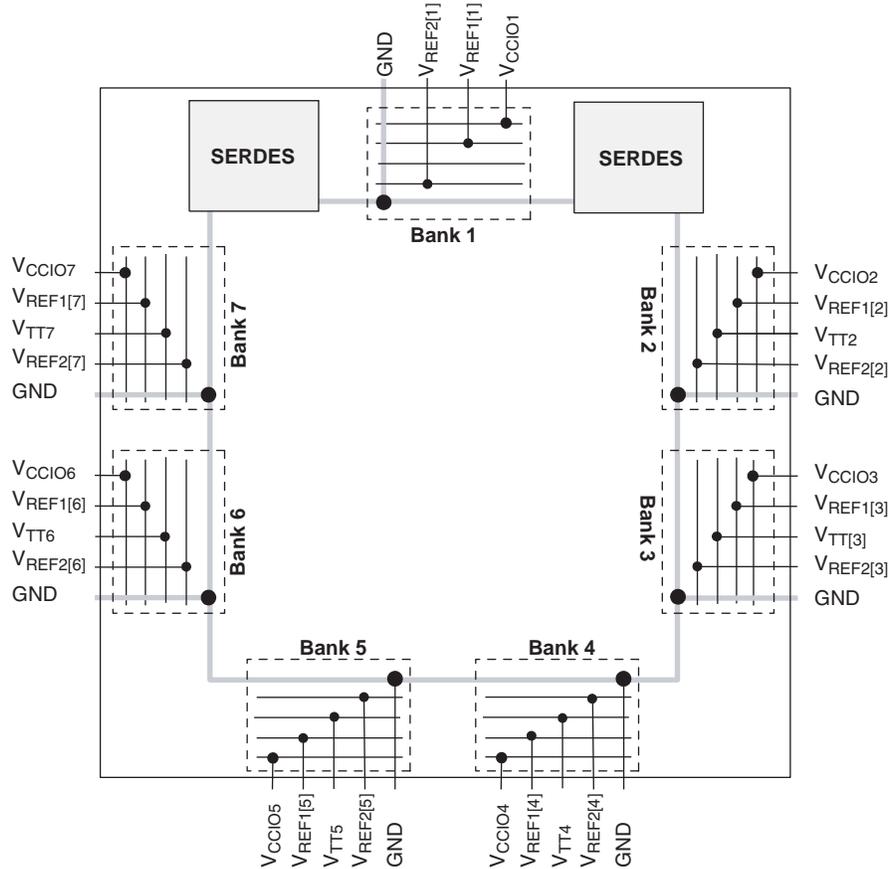

Table 2-7. Maximum Number of I/Os Per Bank in LatticeSC Family

Device	LFSC/M15	LFSC/M25	LFSC/M40	LFSC/M80	LFSC/M115
Bank1	104	80	136	80	136
Bank2	28	36	60	96	136
Bank3	60	84	96	132	156
Bank4	72	100	124	184	208
Bank5	72	100	124	184	208
Bank6	60	84	96	132	156
Bank7	28	36	60	96	136

Note: Not all the I/Os of the Banks are available in all the packages

The LatticeSC devices contain three types of PURESPEED I/O buffers:

1. **Left and Right Sides (Banks 2, 3, 6 and 7)**

These buffers can support LVCMOS standards up to 2.5V. A differential output driver (for LVDS and RSFS) is provided on all primary PIO pairs (A and B) and differential receivers are available on all pairs. Complimentary drivers are available. Adaptive input logic is available on PIOs A or C.

2. **Top Side (Bank 1)**

These buffers can support LVCMOS standards up to 3.3V, including PCI33, PCI-X33 and SSTL-33. Differential receivers are provided on all PIO pairs but differential drivers for LVDS and RSFS are not available. Adaptive input logic is not available on this side. Complimentary output drivers are available.

Density Shifting

The LatticeSC family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

LatticeSC/M External Switching Characteristics³

Over Recommended Commercial Operating Conditions at VCC = 1.2V +/- 5%

Parameter	Description	-7		-6		-5		Units
		Min.	Max.	Min.	Max.	Min.	Max.

t _{H_IDLY}	Latch FF, Input Hold - PIO Input Register with input delay	-0.30	—	-0.30	—	-0.30	—	ns

1. No PLL delay tuning (clock injection removal mode, system clock feedback).

2. Using LVCMOS25 12mA I/O. Timing adders for other supported I/O technologies are specified in the LatticeSC Family Timing Adders table.

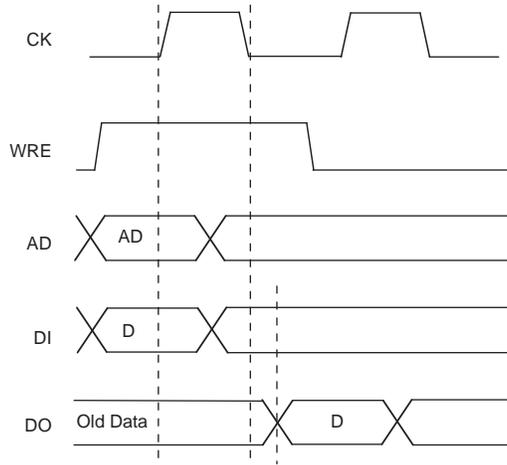

3. Complete Timing Parameters for a user design are incorporated when running ispLEVER. This is a sampling of the key timing parameters.

Timing specs are for non-AIL applications.

Timing Diagrams

PFU Timing Diagrams

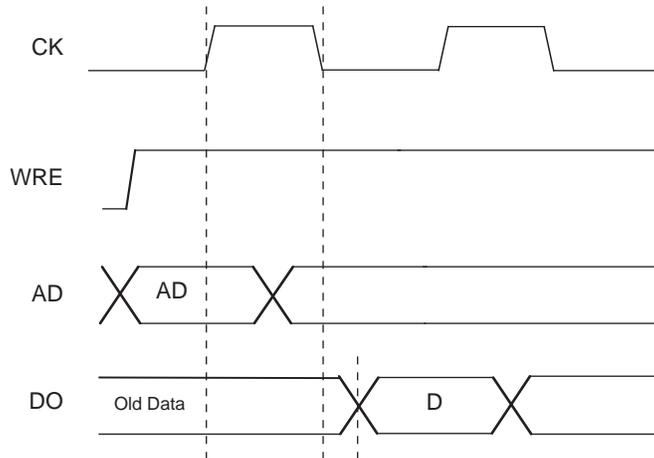

Figure 3-4. Slice Single/Dual Port Write Cycle Timing

Notes:

- Rising Edge for latching WREN, WAD and DATAIN.
- WREN must continue past falling edge clock.
- Data output occurs on negative edge.

1. Differential pair grouping within a PCI is A (True) and B (complement) and C (True) and D (Complement).
2. The LatticeSC/M40 and LatticeSC/M80 in an 1152-pin package support a 32-bit MPI interface.
