Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

1. When not specified V_{CCIO} can be set anywhere in the valid operating range.
2. V_{CCIO} needed for on-chip termination to $V_{CCIO}/2$ or V_{CCIO} only. V_{CCIO} is not specified for off-chip termination or V_{TT} termination.
3. All ratioed input buffers and dedicated pin input buffers include hysteresis with a typical value of 50mV.

VDDAX25 needs to be connected independent of the use of the SERDES. This supply is used to control the SERDES CML I/O regardless of the SERDES being used in the design.

Supported Source Synchronous Interfaces

The LatticeSC devices contain a variety of hardware, such as delay elements, DDR registers and PLLs, to simplify the implementation of Source Synchronous interfaces. Table 2-11 lists Source Synchronous and DDR/QDR standards supported in the LatticeSC. For additional detail refer to technical information at the end of the data sheet.

Table 2-11. Source Synchronous Standards Table[1]

Source Synchronous Standard	Clocking	Speeds (MHz)	Data Rate (Mbps)
RapidIO	DDR	500	1000
SPI4.2 (POS-PHY4)/NPSI	DDR	500	1000
SFI4/XSBI	DDR SDR	334 667	667
XGMII	DDR	156.25	312
CSIX	SDR	250	250
QDRII/QDRII+ memory interface	DDR	300	600
DDR memory interface	DDR	240	480
DDRII memory interface	DDR	333	667
RLDRAM memory interface	DDR	400	800

1. Memory width is dependent on the system design and limited by the number of I/Os in the device.

flexiPCS™ (Physical Coding Sublayer Block)

flexiPCS Functionality

The LatticeSC family combines a high-performance FPGA fabric, high-performance I/Os and large embedded RAM in a single industry leading architecture. LatticeSC devices also feature up to 32 channels of embedded SERDES with associated Physical Coding Sublayer (PCS) logic. The flexiPCS logic can be configured to support numerous industry standard high-speed data transfer protocols.

Each channel of flexiPCS logic contains dedicated transmit and receive SERDES for high-speed, full-duplex serial data transfers at data rates up to 3.8 Gbps. The PCS logic in each channel can be configured to support an array of popular data protocols including SONET (STS-12/STS-12c, STS-48/STS-48c, and TFI-5 support of 10 Gbps or above), Gigabit Ethernet (compliant to the IEEE 1000BASE-X specification), 1.02 or 2.04 Gbps Fibre Channel, PCI-Express, and Serial RapidIO. In addition, the protocol based logic can be fully or partially bypassed in a number of configurations to allow users flexibility in designing their own high-speed data interface.

Protocols requiring data rates above 3.8 Gbps can be accommodated by dedicating either one pair or all four channels in one flexiPCS quad block to one data link. One quad can support full-duplex serial data transfers at data rates up to 15.2 Gbps. A single flexiPCS quad can be configured to support 10Gb Ethernet (with a fully compliant XAUI interface), 10Gb Fibre Channel, and x4 PCI-Express and 4x RapidIO.

The flexiPCS also provides bypass modes that allow a direct 8-bit or 10-bit interface from the SERDES to the FPGA logic which can also be geared to run at 1/2 speed for a 16-bit or 20-bit interface to the FPGA logic. Each SERDES pin can be DC coupled independently and can allow for both high-speed and low-speed operation down to DC rates on the same SERDES pin, as required by some Serial Digital Video applications.

The ispLEVER design tools from Lattice support all modes of the flexiPCS. Most modes are dedicated to applications associated with a specific industry standard data protocol. Other more general purpose modes allow a user to define their own operation. With ispLEVER, the user can define the mode for each quad in a design. Nine modes are currently supported by the ispLEVER design flow:

flexiPCS quads are not dedicated solely to industry standard protocols. Each quad (and each channel within a quad) can be programmed for many user defined data manipulation modes. For example, modes governing user-defined word alignment and multi-channel alignment can be programmed for non-standard protocol applications.

For more information on the functions and use of the flexiPCS, refer to the LatticeSC/M Family flexiPCS Data Sheet.

System Bus

Each LatticeSC device connects the FPGA elements with a standardized bus framework referred to as a System Bus. Multiple bus masters optimize system performance by sharing resources between different bus masters such as the MPI and configuration logic. The wide data bus configuration of 32 bits with 4-bit parity supports high-bandwidth, data intensive applications.

There are two types of interfaces on the System Bus, master and slave. A master interface has the ability to perform actions on the bus, such as writes and reads to and from a specific address. A slave interface responds to the actions of a master by accepting data and address on a write and providing data on a read. The System Bus has a memory map which describes each of the slave peripherals that is connected on the bus. Using the addresses listed in the memory map, a master interface can access each of the slave peripherals on the System Bus. Any and all peripherals on the System Bus can be used at the same time. Table 2-12 list all of the available user peripherals on the System Bus after device power-up.

Table 2-12. System Bus User Peripherals

Peripheral	Name	Interface Type
Micro Processor Interface	MPI	Master
User Master Interface	UMI	Master
User Slave Interface	USI	Slave
Serial Management Interface (PLL, DLL, User Logic)	SMI	Slave
Physical Coding Sublayer	PCS	Slave
Direct FPGA Access	DFA	Slave

The peripherals listed in Table 2-12 can be added when the System Bus module is created using Module IP/Manager (ispLEVER Module/IP Manager).

Figure 2-31 also lists the existing peripherals on the System Bus. The gray boxes are available only during configuration. Refer to Lattice technical note TN1080, LatticeSC sysCONFIG Usage Guide, for configuration options. The Status and Config box refers to internal System Bus registers. This document presents all the interfaces listed in Table 2-12 in detail to help the user utilize the desired functions of the System Bus.
