Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Density Shifting

The LatticeSC family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

Signal Descriptions

Signal Name	I/O	Description
General Purpose		
P[Edge] [Row/Column Number*]_[A/B/C/D]	I/O	<p>[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).</p> <p>[Row/Column Number] indicates the PIC row or the column of the device on which the PIC exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.</p> <p>[A/B/C/D] indicates the PIO within the PIC to which the pad is connected.</p> <p>Some of these user programmable pins are shared with special function pins. These pin when not used as special purpose pins can be programmed as I/Os for user logic.</p> <p>During configuration the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.</p>
VREF1_x, VREF2_x	—	The reference supply pins for I/O bank x. Any I/O pin in a bank can be assigned as a reference supply pin, but software defaults use designated pin.
NC	—	No connect. NC pins should not be connected to any active signals, VCC or GND.
Non-SERDES Power Supplies		
VCCIOx	—	VCCIO - The power supply pins for I/O bank x. Dedicated pins.
VCC12 ¹	—	1.2V supply for configuration logic, PLLs and SERDES Rx, Tx and PLL. All VCC12 pins must be connected. As VCC12 supplies power for analog circuitry, VCC12 should be quiet and isolated from noisy digital board supplies.
VTT_x	—	Termination voltage for bank x. When VTT termination is not required, or used to provide the common mode termination voltage (VCMT), these pins can be left unconnected on the device. VCMT function is not used in the bank. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float.
GND	—	GND - Ground. Dedicated pins. All grounds must be electrically connected at the board level.
VCC	—	VCC - The power supply pins for core logic. Dedicated pins (1.2V/1.0V).
VCCAUX	—	VCCAUX - Auxiliary power supply pin - powers all differential and referenced input buffers. Dedicated pins (2.5V).
VCCJ	—	VCCJ - The power supply pin for JTAG Test Access Port.
PROBE_VCC	—	VCC signal - Connected to internal VCC node. Can be used for feedback to control an external board power converter. Can be unconnected if not used.
