Lattice Semiconductor Corporation - LFSCM3GA115EP1-5FF1152I Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	28750
Number of Logic Elements/Cells	115000
Total RAM Bits	7987200
Number of I/O	660
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1152-BBGA, FCBGA
Supplier Device Package	1152-FCBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga115ep1-5ff1152i

Modes of Operation

Each Slice is capable of four modes of operation: Logic, Ripple, RAM and ROM. Table 2-2 lists the modes and the capability of the Slice blocks.

Table 2-2. Slice Modes

	Logic	Ripple	RAM	ROM
PFU Slice	LUT 4x2 or LUT 5x1	2-bit Arithmetic Unit	SPR 16x2 DPR 16x2	ROM 16x2

Logic Mode

In this mode, the LUTs in each Slice are configured as combinatorial lookup tables. A LUT4 can have 16 possible input combinations. Any logic function with four inputs can be generated by programming this lookup table. Since there are two LUT4s per Slice, a LUT5 can be constructed within one Slice. Larger lookup tables such as LUT6, LUT7 and LUT8 can be constructed by concatenating other Slices in the PFU.

Ripple Mode

Ripple mode allows the efficient implementation of small arithmetic functions. In ripple mode, the following functions can be implemented by each Slice:

- Addition 2-bit
- Subtraction 2-bit
- Up counter 2-bit
- Down counter 2-bit
- Comparator functions of A and B inputs
  - A greater-than-or-equal-to B
  - A not-equal-to B
  - A less-than-or-equal-to B

Ripple Mode includes an optional configuration that performs arithmetic using fast carry chain methods. In this configuration (also referred to as CCU2 mode) two additional signals, Carry Generate and Carry Propagate, are generated on a per slice basis to allow fast arithmetic functions to be constructed by concatenating Slices.

RAM Mode

In this mode, distributed RAM can be constructed using each LUT block as a 16x1-bit memory. Through the combination of LUTs and Slices, a variety of different memories can be constructed.

The Lattice design tools support the creation of a variety of different size memories. Where appropriate, the software will construct these using distributed memory primitives that represent the capabilities of the Slice. Table 2-3 shows the number of Slices required to implement different distributed RAM primitives. Dual port memories involve the pairing of two Slices, one Slice functions as the read-write port. The other companion Slice supports the read-only port. For more information on RAM mode, please see details of additional technical documentation at the end of this data sheet.

Table 2-3. Number of Slices Required For Implementing Distributed RAM

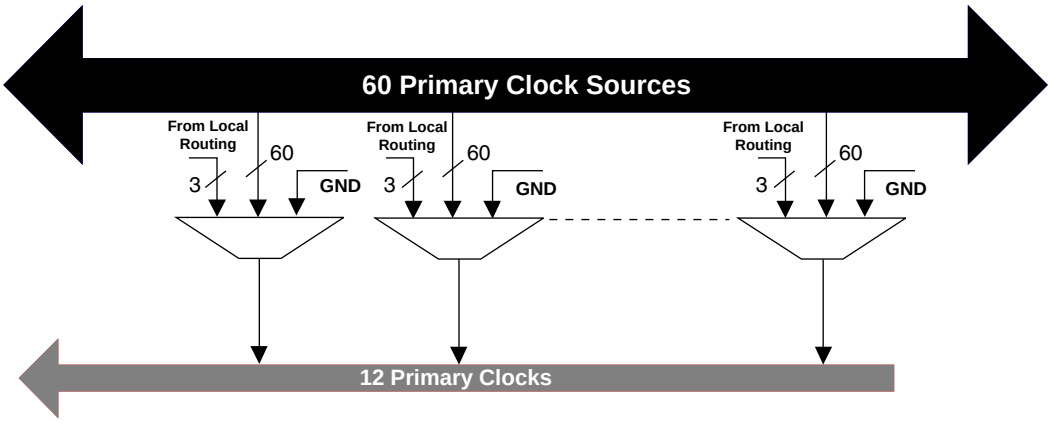
	SPR16x2	DPR16x2
Number of Slices	1	2

Note: SPR = Single Port RAM, DPR = Dual Port RAM

ROM Mode

The ROM mode uses the same principal as the RAM modes, but without the Write port. Pre-loading is accomplished through the programming interface during configuration.

Figure 2-6. Per Quadrant Clock Selection



Note: GND is available to switch off the network.

Secondary Clocks

In addition to the primary clock network and edge clocks the LatticeSC devices also contain a secondary clock network. Built of X6 style routing elements this secondary clock network is ideal for routing slower speed clock and control signals throughout the device preserving high-speed clock networks for the most timing critical signals.

Edge Clocks

LatticeSC devices have a number of high-speed edge clocks that are intended for use with the PIOs in the implementation of high-speed interfaces. There are eight edge clocks per bank for the top and bottom of the device. The left and right sides have eight edge clocks per side for both banks located on that side. Figure 2-7 shows the arrangement of edge clocks.

Edge clock resources can be driven from a variety of sources. Edge clock resources can be driven from:

- Edge clock PIOs in the same bank
- Primary clock PIOs in the same bank
- Routing
- Adjacent PLLs and DLLs
- ELSR output from the clock divider

Internal Logic Analyzer Capability (ispTRACY)

All LatticeSC devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time. For additional detail refer to technical information at the end of the data sheet.

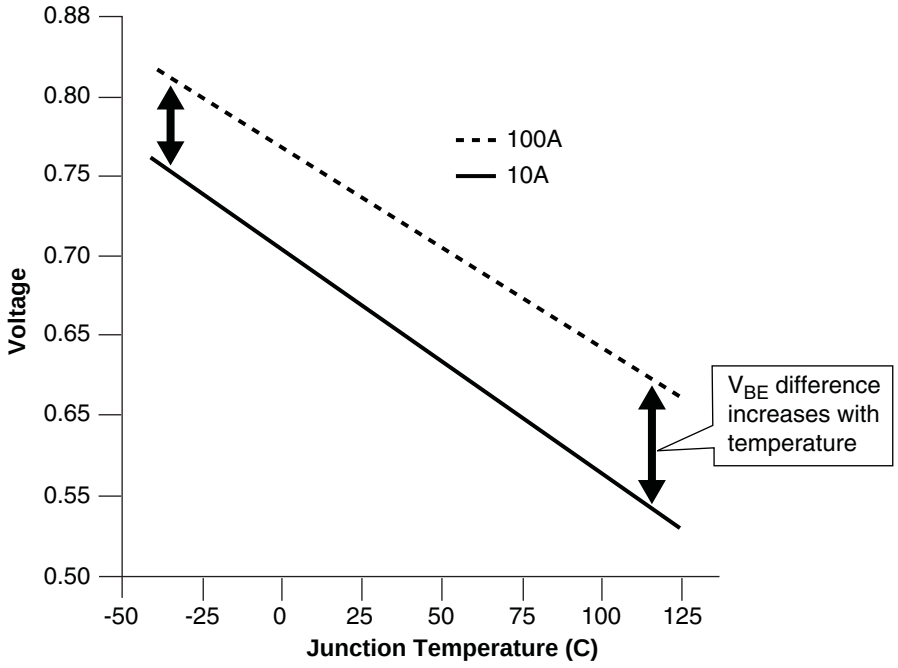
Temperature Sensing

Lattice provides a way to monitor the die temperature by using a temperature-sensing diode that is designed into every LatticeSC device. The difference in V_{BE} of the diode at two different forward currents varies with temperature. This relationship is shown in Figure 2-33. The accuracy of the temperature-sensing diode is typically +/- 10°C.

On packages that include PROBE_GND, the most accurate measurements will occur between the TEMP pin and the PROBE_GND pin. On packages that do not include PROBE_GND, measurements should be made between the TEMP pin and board ground.

This temperature-sensing diode is designed to work with an external temperature sensor such as the Maxim 1617A. The Maxim 1617A is configured to measure difference in V_{BE} (of the temperature-sensing diode) at 10µA and at 100µA. This difference in V_{BE} voltage varies with temperature at approximately 1.64 mV/°C. A typical device with a 85°C junction temperature will measure approximately 593mV. For additional detail refer to TN1115, Temperature Sensing Diode in LatticeSC Devices.

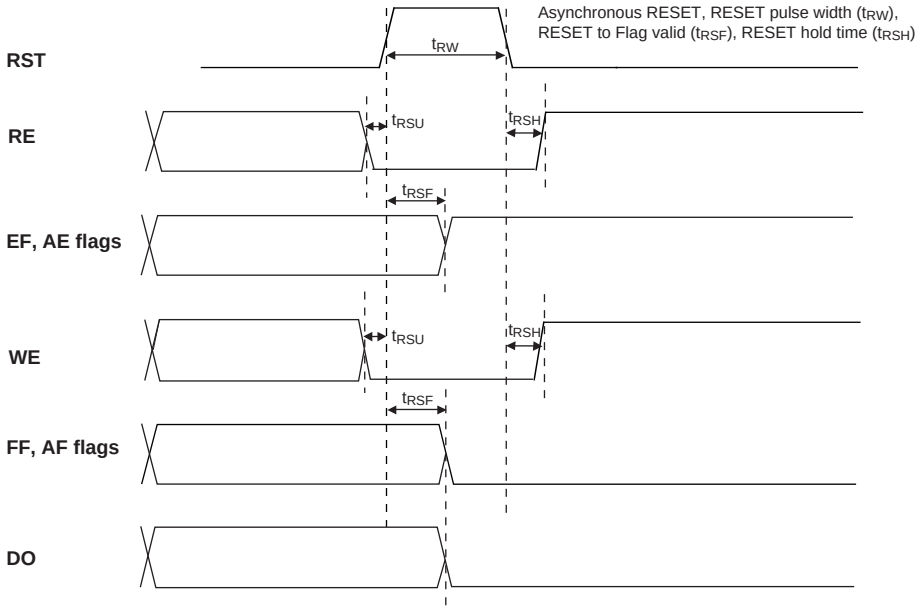
Figure 2-33. Sensing Diode Typical Characteristics



Oscillator

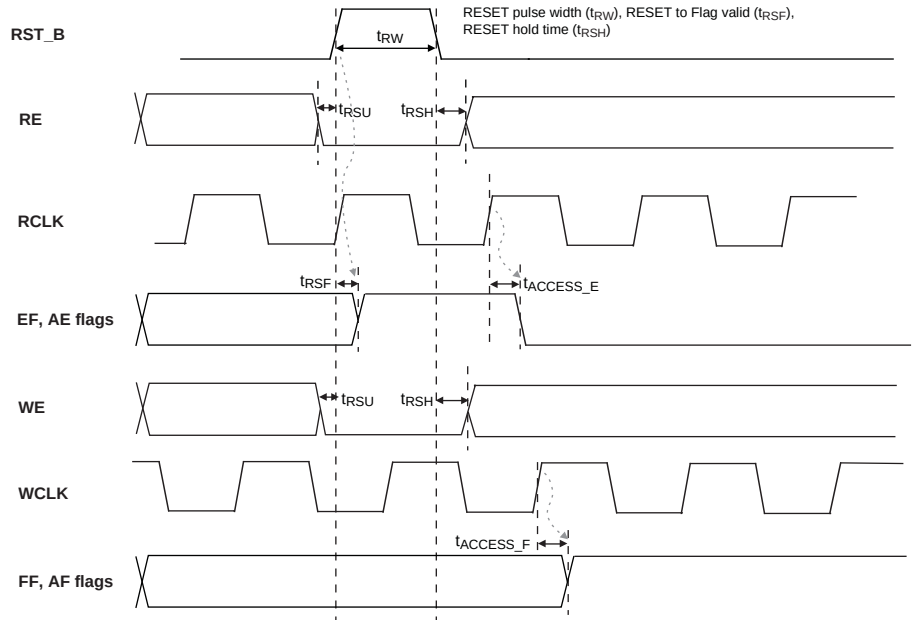
Every LatticeSC device has an internal CMOS oscillator, which is used as a master serial clock for configuration and is also available as a potential general purpose clock (MCK) for the FPGA core. There is a K divider (divide by 2/4/8/16/32/64/128) available with this oscillator to get lower MCK frequencies. This clock is available as a general purpose clock signal to the software routing tool. For additional detail refer to technical information at the end of the data sheet.

Figure 3-10. FIFO Reset Waveform



Note: RE and WE must be deactivated t_{RSU} before the Positive FIFO reset edge and enabled t_{RSH} after the FIFO reset negative edge.

Figure 3-11. Read Pointer Reset Waveform



Note: RE and WE must be deactivated t_{RSU} before the Positive FIFO reset edge and enabled t_{RSH} after the FIFO reset negative edge.

Signal Descriptions (Cont.)

Signal Name	I/O	Description
PROBE_GND	—	GND signal - Connected to internal VSS node. Can be used for feedback to control an external board power converter. Can be unconnected if not used.
PLL and Clock Functions (Used as user-programmable I/O pins when not in use for PLL, DLL or clock pins.)		
[LOC]_PLL[T, C]_FB_[A/B]	I	PLL feedback input. Pull-ups are enabled on input pins during configuration. [LOC] indicates the corner the PLL is located in: ULC (upper left), URC (upper right), LLC (lower left) and LRC (lower right). [T, C] indicates whether input is true or complement. [A, B] indicates PLL reference within the corner.
[LOC]_DLL[T, C]_FB_[C, D, E, F]	I	DLL feedback input. Pull-ups are enabled on input pins during configuration. [LOC] indicates the corner the DLL is located in: ULC (upper left), URC (upper right), LLC (lower left) and LRC (lower right). [T/C] indicates whether input is true or complement. [C, D, E, F] indicates DLL reference within a corner. Note: E and F are only available on the lower corners.
[LOC]_PLL[T, C]_IN[A/B]	I	PLL reference clock input. Pull-ups are enabled on input pins during configuration. [LOC] indicates the corner the PLL is located in: ULC (upper left corner), URC (upper right corner), LLC (lower left corner) and LRC (lower right corner). [T, C] indicates whether input is true or complement.[A, B] indicates PLL reference within the corner.
[LOC]_DLL[T, C]_IN[C, D, E, F]		DLL reference clock inputs. Pull-ups are enabled on input pins during configuration. [LOC] indicates the corner the DLL is located in: ULC (upper left corner), URC (upper right corner), LLC (lower left corner) and LRC (lower right corner). [T/C] indicates whether input is true or complement. [C, D, E, F] indicates DLL reference within a corner. Note: E and F are only available on the lower corners. PCKLxy_[0:3] can drive primary clocks, edge clocks, and CLKDIVs. PCLKxy_[4:7] can only drive edge clocks.
PCLKxy_z		General clock inputs. x indicates whether T (true) or C (complement). y indicates the I/O bank the clock is associated with. z indicates the clock number within a bank.
Test and Programming (Dedicated pins. Pull-up is enabled on input pins during configuration.)		
TMS	I	Test Mode Select input, used to control the 1149.1 state machine.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine.
TDI	I	Test Data in pin, used to load data into device using 1149.1 state machine. After power-up, this TAP port can be activated for configuration by sending appropriate command. (Note: once a configuration port is selected it is locked. Another configuration port cannot be selected until the power-up sequence).
TDO	O	Output pin -Test Data out pin used to shift data out of device using 1149.1.
Configuration Pads (Dedicated pins. Used during sysCONFIG.)		
M[3:0]	I	Mode pins used to specify configuration modes values latched on rising edge of INITN.
INITN	I/O	Open Drain pin - Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled that will pull the I/O above 1.5V.
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up.
DONE	I/O	Open Drain pin - Indicates that the configuration sequence is complete, and the startup sequence is in progress.
CCLK	I/O	Configuration Clock for configuring an FPGA in sysCONFIG mode.

Signal Descriptions (Cont.)

Signal Name	I/O	Description
RESETN		Reset. (Also sent to general routing). During configuration it resets the configuration state machine. After configuration this pin can perform the global set/reset (GSR) functions or can be used as a general input pin.
CFGIRQN	O	MPI Interrupt request active low signal is controlled by system bus interrupt controller and may be sourced from any bus error or MPI configuration error. It can be connected to one of MPC860 IRQ pins.
TSALLN	I	Tristates all I/O.
Configuration Pads (User I/O if not used. Used during sysCONFIG.)		
HDC/SI	O	High During Configuration is output high until configuration is complete. It is used as a control output, indicating that configuration is not complete. For SPI modes, this pin is used to download the read command and initial read address into the Flash memory device on the falling edge of SCK. This pin will be connected to SI of the memory. If the SPI mode is used, the 8-bit instruction code 0x03 will be downloaded followed by a 24-bit starting address of 0x000000 or a non-zero stat address for partial reconfiguration. If the SPIX mode has been selected, the 8-bit instruction captured on D[7:0] at power-up will be shifted in and followed by a 32-bit starting address of 0x000000.
LDCN/SCS	O	Low During Configuration is output low until configuration is complete. It is used as a control output, indicating that configuration is not complete. For SPI modes, this is an active low chip select for Flash memories. It will go active after INITN goes high but before SCK begins. During power up LDCN will be low. Once INITN goes high, LDCN will go high for 100ns-200ns after which time it will go back low and configuration can begin. During the 100ns-200ns period, the read instruction will be latched for SPIX mode.
DOUT	O	Serial data output that can drive the D0/DIN of daisy-chained slave devices. The data-stream from this output will propagate preamble bits of the bitstream to daisy-chained devices. Data out on DOUT changes on the rising edge of CCLK.
QOUT/CEON	O	During daisy-chaining configuration, QOUT is the serial data output that can drive the D0/DIN of daisy-chained slave devices that do not propagate preamble bits. Data out on QOUT changes on the rising edge of CCLK. During parallel-chaining configuration, active low CEON enables the cascaded slave device to receive bitstream data.
RDN	I	Used in the asynchronous peripheral configuration mode. A low on RDN changes D[7:3] into status outputs. WRN and RDN should not be used simultaneously. If they are, the write strobe overrides.
WRN	I	When the FPGA is selected, a low on the write strobe, WRN, loads the data on D[7:0] inputs into an internal data buffer.
CS0N CS1	I	Used in the asynchronous peripheral, slave parallel and MPI modes. The FPGA is selected when CS0N is low and CS1 is high. During configuration, a pull-up is enabled on both except with MPI DMA access control.
A[21:0]	I/O	In master parallel mode, A[21:0] is an output and will address the configuration EPROMs up to 4 MB space. For MPI configuration mode, A[17:0] will be the MPI address MPI_ADDR[31:14], A[19:18] will be the transfer size and A[21:20] will be the burst mode and burst in process.
