

Welcome to [E-XFL.COM](#)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	28750
Number of Logic Elements/Cells	115000
Total RAM Bits	7987200
Number of I/O	660
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1152-BBGA
Supplier Device Package	1152-FPBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga115ep1-6ffn1152i

Architecture Overview

The LatticeSC architecture contains an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM Embedded Block RAM (EBR). The upper left and upper right corners of the devices contain SERDES blocks and their associated PCS blocks, as shown in Figure 2-1.

Top left and top right corner of the device contain blocks of SERDES. Each block of SERDES contains four channels (quad). Each channel contains a single serializer and de-serializer, synchronization and word alignment logic. The SERDES quad connects with the Physical Coding Sub-layer (PCS) blocks that contain logic to simultaneously perform alignment, coding, de-coding and other functions. The SERDES quad block has separate supply, ground and reference voltage pins.

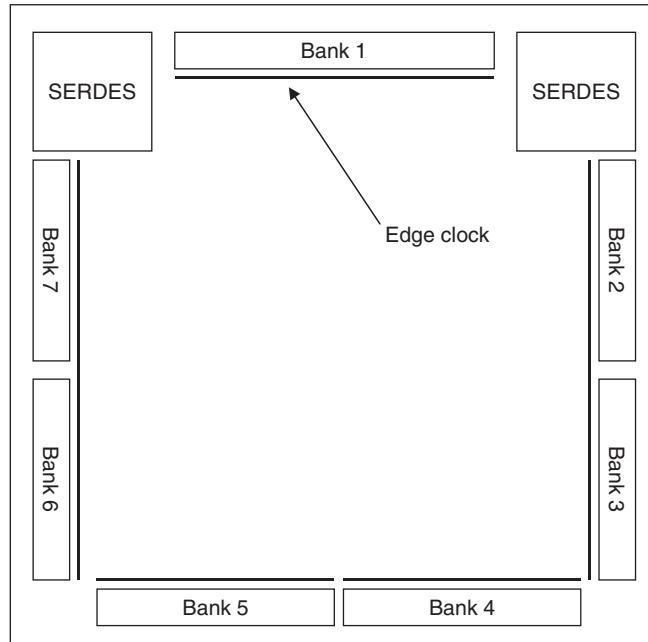

The PICs contain logic to facilitate the conditioning of signals to and from the I/O before they leave or enter the FPGA fabric. The block provides DDR and shift register capabilities that act as a gearbox between high speed I/O and the FPGA fabric. The blocks also contain programmable Adaptive Input Logic that adjusts the delay applied to signals as they enter the device to optimize setup and hold times and ensure robust performance.

sysMEM EBRs are large dedicated fast memory blocks. They can be configured as RAM, ROM or FIFO. These blocks have dedicated logic to simplify the implementation of FIFOs.

The PFU, PIC and EBR blocks are arranged in a two-dimensional grid with rows and columns as shown in Figure 2-1. These blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

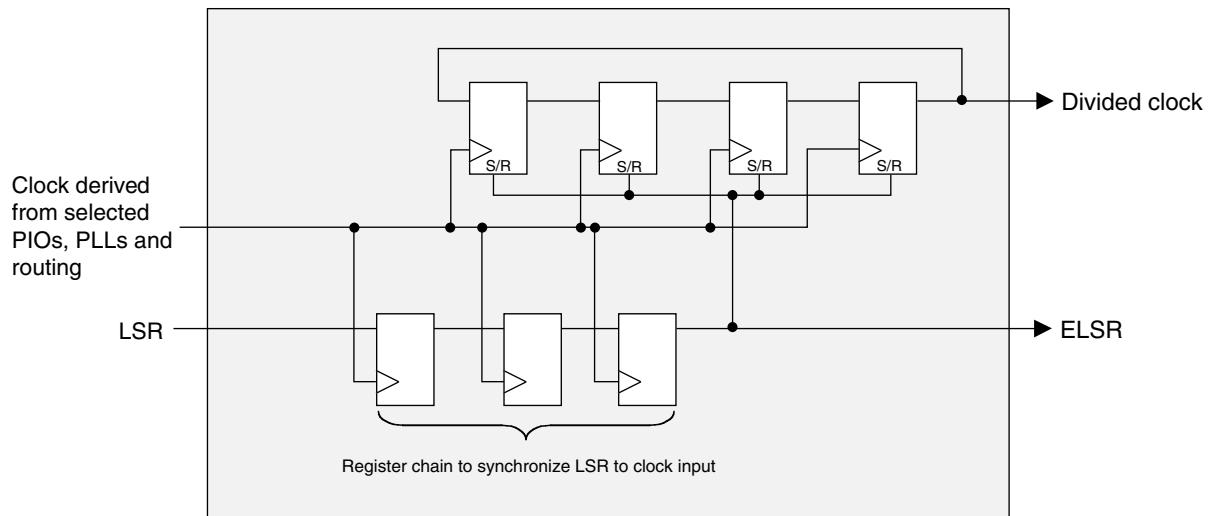

The corners contain the sysCLOCK Analog Phase Locked Loop (PLL) and Delay Locked Loop (DLL) Blocks. The PLLs have multiply, divide and phase shifting capability; they are used to manage the phase relationship of the clocks. The LatticeSC architecture provides eight analog PLLs per device and 12 DLLs. The DLLs provide a simple delay capability and can also be used to calibrate other delays within the device.

Every device in the family has a JTAG Port with internal Logic Analyzer (ispTRACY) capability. The sysCONFIG™ port which allows for serial or parallel device configuration. The system bus simplifies the connections of the external microprocessor to the device for tasks such as SERDES and PCS configuration or interface to the general FPGA logic. The LatticeSC devices use 1.2V as their core voltage operation with 1.0V operation also possible.

Figure 2-7. Edge Clock Resources

Precision Clock Divider

Each set of edge clocks has four high-speed dividers associated with it. These are intended for generating a slower speed system clock from the high-speed edge clock. The block operates in a DIV2 or DIV4 mode and maintains a known phase relationship between the divided down clock and high-speed clock based on the release of its reset signal. The clock dividers can be fed from selected PIOs, PLLs and routing. The clock divider outputs serve as primary clock sources. This circuit also generates an edge local set/reset (ELSR) signal which is fed to the PIOs via the edge clock network and is used for the rest of the I/O gearing logic.

Figure 2-8. Clock Divider Circuit

Dynamic Clock Select (DCS)

The DCS is a global clock buffer with smart multiplexer functions. It takes two independent input clock sources and outputs a clock signal without any glitches or runt pulses. This is achieved irrespective of where the select signal is

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically.

The Phase Select block can modify the phase of the clock signal if desired. The Spread Spectrum block supports the modulation of the PLL output frequency. This reduces the peak energy in the fundamental and its harmonics providing for lower EMI (Electro Magnetic Interference).

The sysCLOCK PLL can be configured at power-up and then, if desired, reconfigured dynamically through the serial memory interface bus which connects with the on-chip system bus. For example, the user can select inputs, loop filters, divider setting, delay settings and phase shift settings. The user can also directly access the SMI bus through the routing.

The PLL clock input, from pin or routing, feeds into an input divider. There are four sources of feedback signal to the feedback divider: from the clock net, directly from the voltage controlled oscillator (VCO) output, from the routing or from an external pin. The signal from the input clock divider and the feedback divider are passed through the programmable delay before entering the phase frequency detector (PFD) unit. The output of this PFD is used to control the voltage controlled oscillator. There is a PLL_LOCK signal to indicate that VCO has locked on to the input clock signal. Figure 2-11 shows the sysCLOCK PLL diagram.

Figure 2-11. PLL Diagram

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

Spread Spectrum Clocking (SSC)

The PLL supports spread spectrum clocking to reduce peak EMI by using “down-spread” modulation. The spread spectrum operation will vary the output frequency (at 30KHz to 500KHz) in a range that is between its nominal value, down to a frequency that is a programmable 1%, 2%, or 3% lower than normal.

Digital Locked Loop (DLLs)

In addition to PLLs, the LatticeSC devices have up to 12 DLLs per device. DLLs assist in the management of clocks and strobes. DLLs are well suited to applications where the clock may be stopped or transferring jitter from input to output is important, for example forward clocked interfaces. PLLs are good for applications requiring the lowest output jitter or jitter filtering. All DLL outputs are routed as primary/edge clock sources.

The DLL has two independent clock outputs, CLKOP and CLKOS. These outputs can individually select one of the outputs from the tapped delay line. The CLKOS has optional fine phase shift and divider blocks to allow this output to be further modified, if required. The fine phase shift block allows the CLKOS output to phase shifted a further 45, 22.5 or 11.25 degrees relative to its normal position. LOCK output signal is asserted when the DLL is locked. The ALU HOLD signal setting allows users to freeze the DLL at its current delay setting.

- Serial RapidIO
- PCI-Express
- Generic 8b10b

flexiPCS Quad

The flexiPCS logic is arranged in quads containing logic for four independent full-duplex data channels. Each device in the LatticeSC family has up to eight quads of flexiPCS logic. The LatticeSC Family Selection Guide table on the first page of this data sheet contains the number of flexiPCS channels present on the chip. Note that in some packages (particularly lower pin count packages), not all channels from all quads on a given device may be bonded to package pins.

Each quad supports up to four channels of full-duplex data and can be programmed into any one of several protocol based modes. Each quad requires its own reference clock which can be sourced externally or from the FPGA logic. The user can utilize between one and four channels in a quad, depending on the application.

Figure 2-30 shows an example of four flexiPCS quads in a LatticeSC device. Quads are labeled according to the address of their software controlled registers.

Figure 2-30. LatticeSC flexiPCS

Since each quad has its own reference clock, different quads can support different standards on the same chip. This feature makes the LatticeSC family of devices ideal for bridging between different standards.

December 2011

Data Sheet DS1004

Absolute Maximum Ratings

Supply Voltage V_{CC} , V_{CC12} , V_{DDIB} , V_{DDOB}	-0.5 to 1.6V
Supply Voltage V_{CCAUX} , V_{DDAX25} , V_{TT}	-0.5 to 2.75V
Supply Voltage V_{CCJ}	-0.5 to 3.6V
Supply Voltage V_{CCIO} (Banks 1, 4, 5)	-0.5 to 3.6V
Supply Voltage V_{CCIO} (Banks 2, 3, 6, 7)	-0.5 to 2.75V
Input or I/O Tristate Voltage Applied (Banks 1, 4, 5)	-0.5 to 3.6V
Input or I/O Tristate Voltage Applied (Banks 2, 3, 6, 7)	-0.5 to 2.75V
Storage Temperature (Ambient).....	-65 to 150°C
Junction Temperature Under Bias (T_j)	+125°C

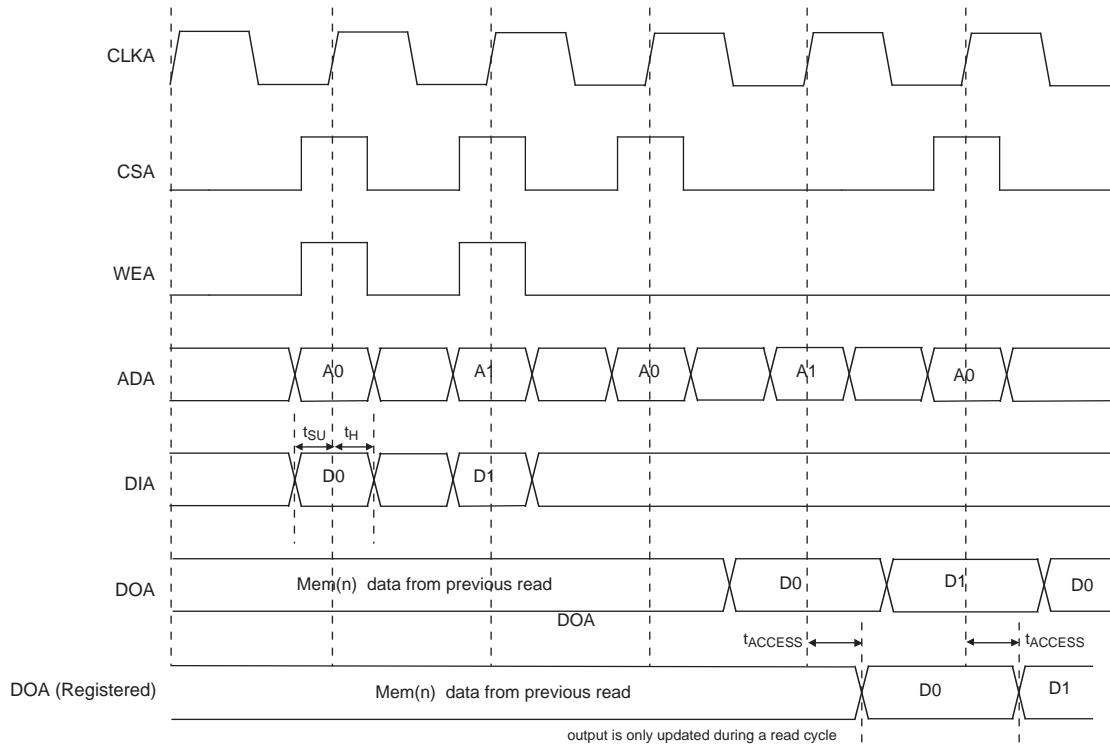

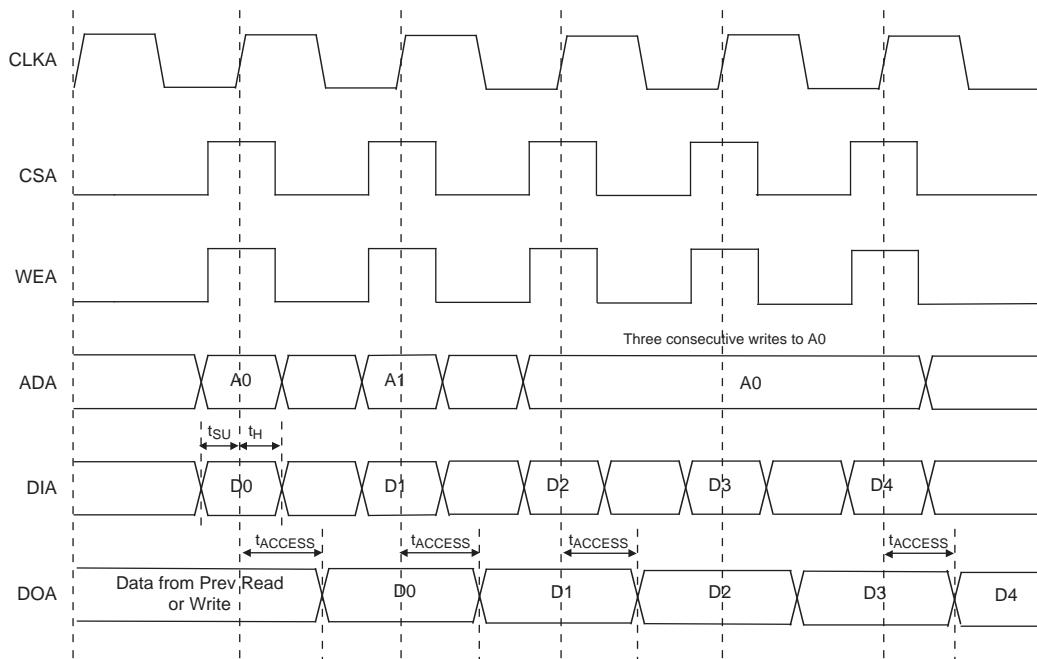

Notes:

1. Stress above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.
2. Compliance with the Lattice Thermal Management document is required.
3. All voltages referenced to GND.
4. Undershoot and overshoot of -2V to ($VIHMAX + 2$) volts is permitted for a duration of <20ns.

Recommended Operating Conditions

Symbol	Parameter	Min.	Max.	Units
V_{CC}^5	Core Supply Voltage (Nominal 1.2V Operation)	0.95	1.26	V
V_{CCAUX}^6	Programmable I/O Auxiliary Supply Voltage	2.375	2.625	V
$V_{CCIO}^{1, 2, 5, 6}$	Programmable I/O Driver Supply Voltage (Banks 1, 4, 5)	1.14	3.45	V
$V_{CCIO}^{1, 2, 5, 6}$	Programmable I/O Driver Supply Voltage (Banks 2, 3, 6, 7)	1.14	2.625	V
$V_{CC12}^{4, 5}$	Internal 1.2V Power Supply Voltage for Configuration Logic and FPGA PLL, SERDES PLL Power Supply Voltage and SERDES Analog Supply Voltage	1.14	1.26	V
V_{DDIB}	SERDES Input Buffer Supply Voltage	1.14	1.575	V
V_{DDOB}	SERDES Output Buffer Supply Voltage	1.14	1.575	V
V_{DDAX25}	SERDES Termination Auxiliary Supply Voltage	2.375	2.625	V
$V_{CCJ}^{1, 5}$	Supply Voltage for IEEE 1149.1 Test Access Port	1.71	3.45	V
$V_{TT}^{2, 3}$	Programmable I/O Termination Power Supply	0.5	$V_{CCAUX} - 0.5$	V
t_{JCOM}	Junction Temperature, Commercial Operation	0	+85	C
t_{JIND}	Junction Temperature, Industrial Operation	-40	105	C

1. If V_{CCIO} or V_{CCJ} is set to 2.5V, they must be connected to the same power supply as V_{CCAUX} .
2. See recommended voltages by I/O standard in subsequent table.
3. When V_{TT} termination is not required, or used to provide the common mode termination voltage (V_{CMT}), these pins can be left unconnected on the device.
4. V_{CC12} cannot be lower than V_{CC} at any time. For 1.2V operation, it is recommended that the V_{CC} and V_{CC12} supplies be tied together with proper noise decoupling between the digital VCC and analog VCC12 supplies.
5. V_{CC} , V_{CCIO} (all banks), V_{CC12} and V_{CCJ} must reach their minimum values before configuration will proceed.
6. If V_{CCIO} for a bank is nominally 1.2V/1.5V/1.8V, then V_{CCAUX} must always be higher than V_{CCIO} during power up.

Figure 3-8. Read Mode with Input and Output Registers**Figure 3-9. Write Through (SP Read/Write On Port A, Input Registers Only)**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive edge of the clock.

LatticeSC/M sysCONFIG Port Timing

Over Recommended Operating Conditions

Parameter	Description	Min.	Max.	Units
General Configuration Timing				
$t_{S MODE}$	M[3:0] Setup Time to INITN High	0	—	ns
$t_{H MODE}$	M[3:0] Hold Time from INITN High	600	—	ns
t_{RW}	RESETN Pulse Width Low to Start Reconfiguration (1.2 V)	50 (or 100 at 0.95V)	—	ns
t_{PGW}	PROGRAMN Pulse Width Low to Start Reconfiguration (1.2 V)	50 (or 100 at 0.95V)	—	ns
$f_{ESB_CLK_FRQ}$	System Bus ESB_CLK Frequency (No Wait States)	—	133	MHz
sysCONFIG Master Parallel Configuration Mode				
t_{SMB}	D[7:0] Setup Time to RCLK High	6	—	ns
