### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	3750
Number of Logic Elements/Cells	15000
Total RAM Bits	1054720
Number of I/O	139
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga15ep1-5f256c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga15ep1-5f256c</a>

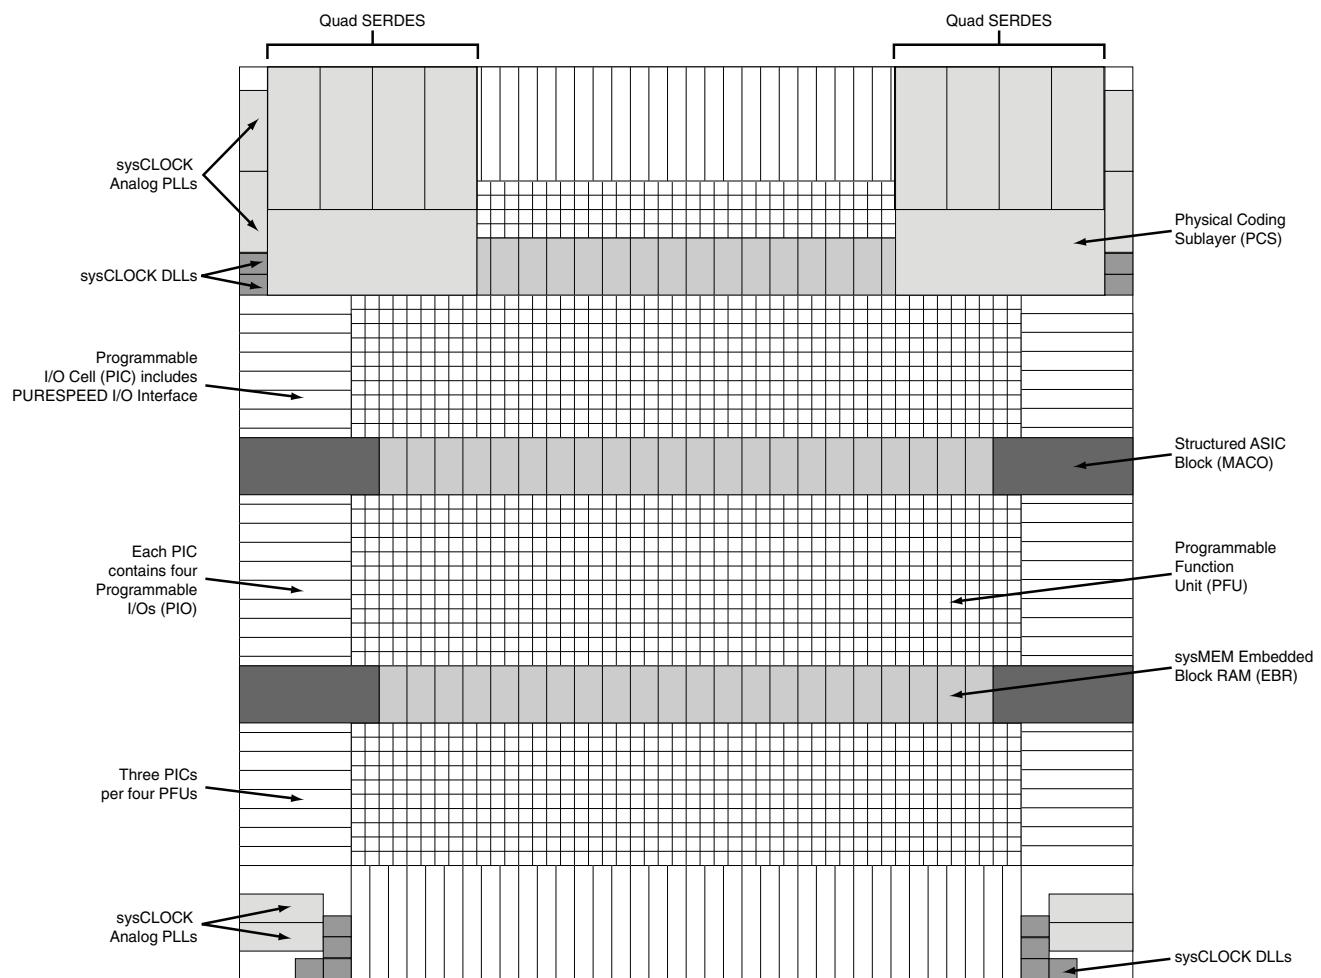

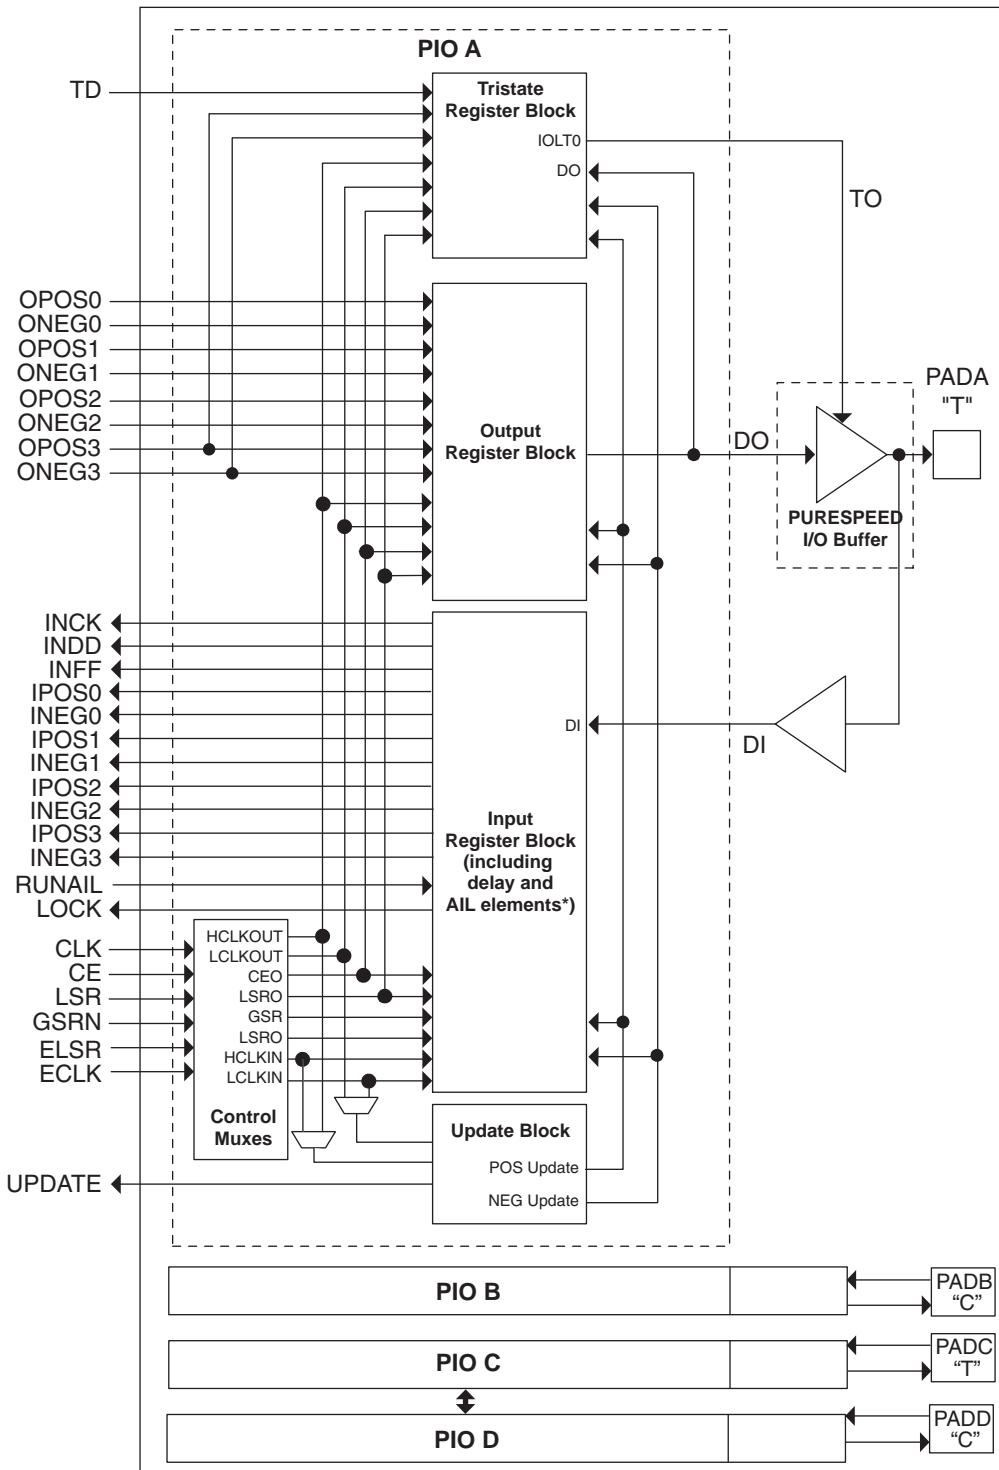

**Figure 2-1. Simplified Block Diagram (Top Level)**

Figure 2-17. PIC Diagram

\*AIL only on A or C pads located on the left, right and bottom of the device.

The A/B PIOs on the left and the right of the device can be paired to form a differentiated driver. The A/B and C/D PIOs on all sides of the device can be paired to form differential receivers. Either A or C PIOs on all sides except the one on top also provide a connection to an adaptive input logic capability that facilitates the implementation of

## PURESPEED I/O Buffer Banks

LatticeSC devices have seven PURESPEED I/O buffer banks; each is capable of supporting multiple I/O standards. Each PURESPEED I/O bank has its own I/O supply voltage ( $V_{CCIO}$ ), and two voltage references  $V_{REF1}$  and  $V_{REF2}$  resources allowing each bank to be completely independent from each other. Figure 2-26 shows the seven banks and their associated supplies. Table 2-7 lists the maximum number of I/Os per bank for the whole LatticeSC family.

In the LatticeSC devices, single-ended output buffers and ratioed input buffers (LVTTL, LVCMOS, PCI33 and PCIX33) are powered using  $V_{CCIO}$ . In addition to the bank  $V_{CCIO}$  supplies, the LatticeSC devices have a  $V_{CC}$  core logic power supply, and a  $V_{CCAUX}$  supply that power all differential and referenced buffers.  $V_{CCAUX}$  also powers a predriver of single-ended output buffers to enhance buffer performance.

Each bank can support up to two separate VREF voltages,  $V_{REF1}$  and  $V_{REF2}$  that set the threshold for the referenced input buffers. In the LatticeSC devices any I/O pin in a bank can be configured to be a dedicated reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

Differential drivers have user selectable internal or external bias. External bias is brought in by the  $V_{REF1}$  pin in the bank. External bias for differential buffers is needed for applications that require tighter than standard output common mode range.

Since a bank can have only one external bias circuit for differential drivers, LVDS and RSDS differential outputs can be mixed in a bank.

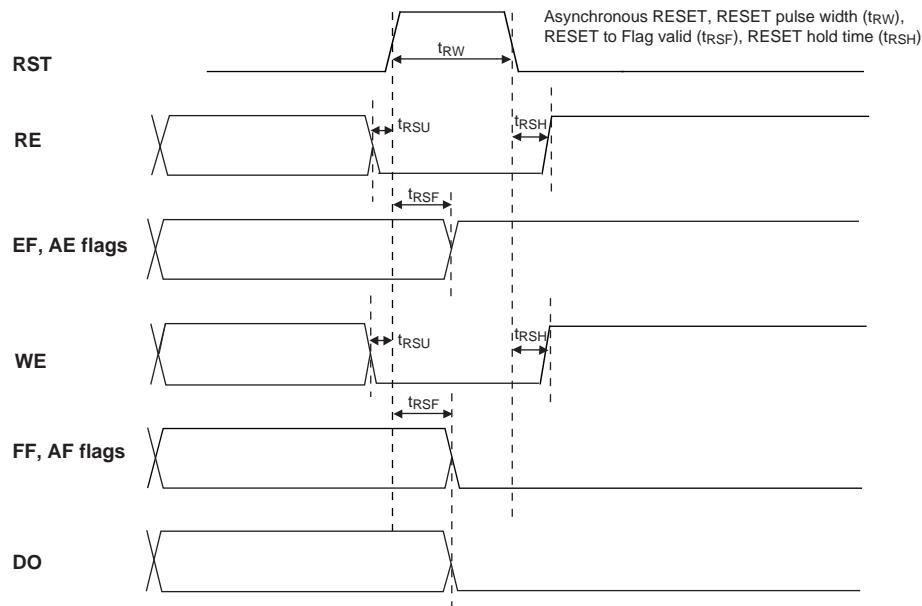

If a differential driver is configured in a bank, one pin in that bank becomes a DIFFR pin. This DIFFR pin must be connected to ground via an external 1K +/-1% ohm resistor. Note that differential drivers are not supported in banks 1, 4 and 5.

In addition, there are dedicated Terminating Supply ( $V_{TT}$ ) pins to be used as terminating voltage for one of the two ways to perform parallel terminations. These  $V_{TT}$  pins are available in banks 2-7, these pins are not available in some packages. When VTT termination is not required, or used to provide the common mode termination voltage (VCMT), these pins can be left unconnected on the device. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float.

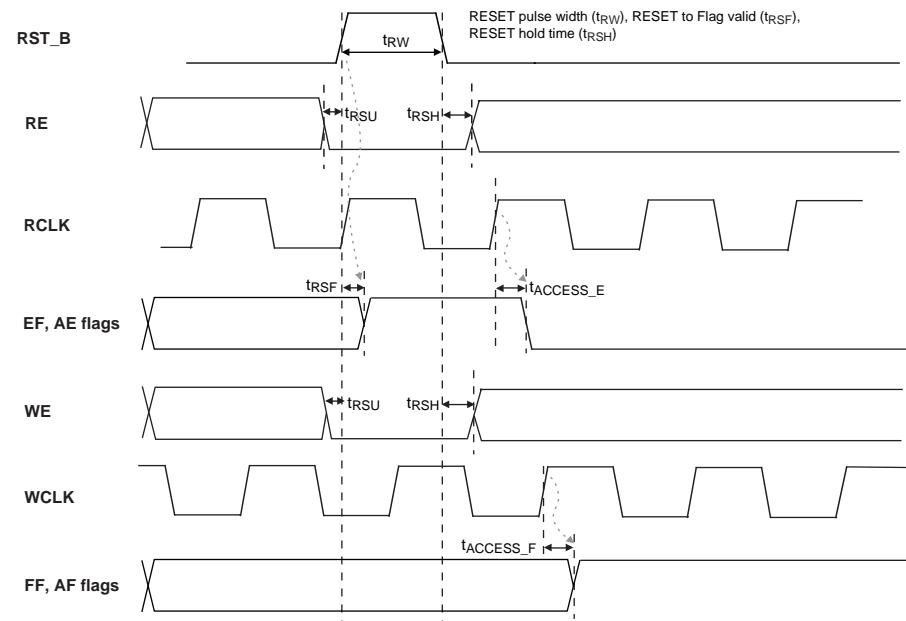

There are further restrictions on the use of  $V_{TT}$  pins, for additional details refer to technical information at the end of this data sheet.

## Switching Characteristics

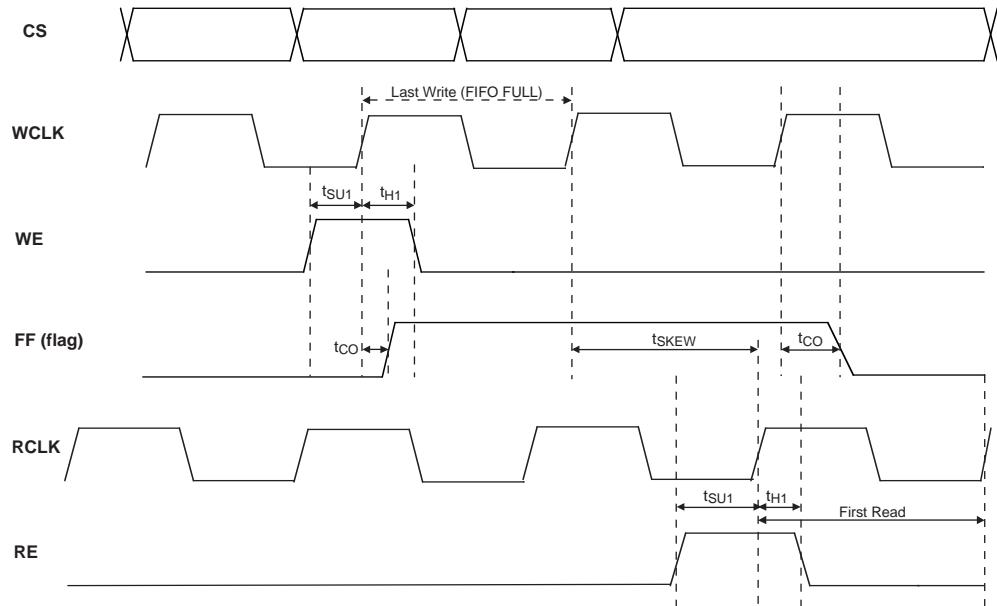

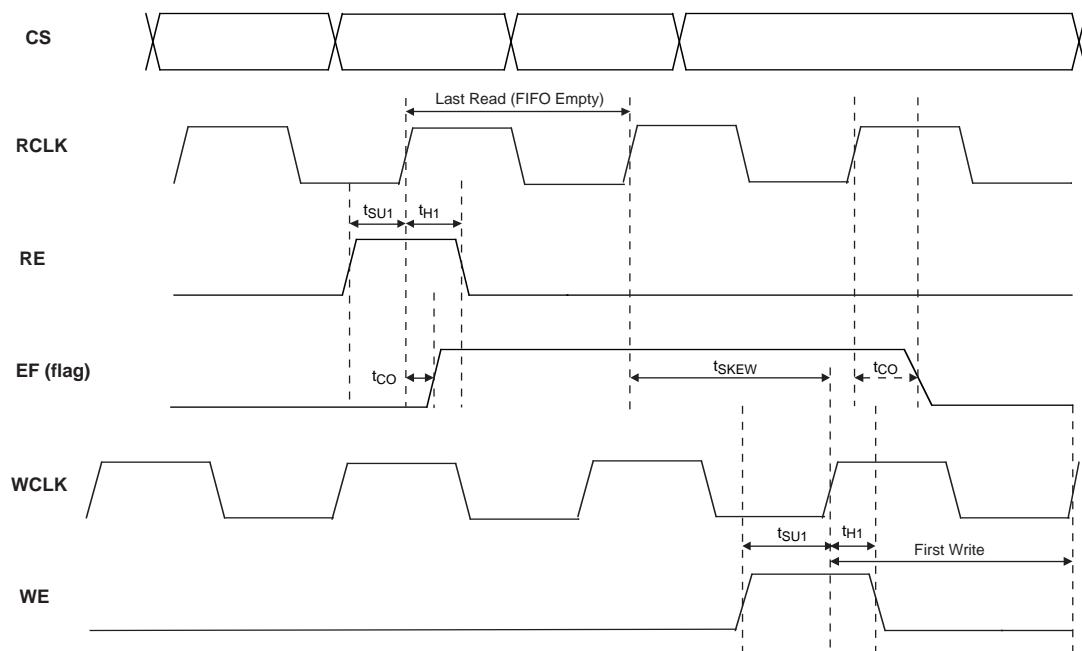

All devices are 100% functionally tested. Listed below are representative values of internal and external timing parameters. For more specific, more precise, and worst-case guaranteed data at a particular temperature and voltage, use the values reported by the static timing analyzer in the ispLEVER design tool from Lattice and back-annotate to the simulation net list.

**Figure 3-10. FIFO Reset Waveform**

Note: RE and WE must be deactivated  $t_{RSU}$  before the Positive FIFO reset edge and enabled  $t_{RSH}$  after the FIFO reset negative edge.

**Figure 3-11. Read Pointer Reset Waveform**

Note: RE and WE must be deactivated  $t_{RSU}$  before the Positive FIFO reset edge and enabled  $t_{RSH}$  after the FIFO reset negative edge.
