Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Tristate Register Block

The tristate register block provides the ability to register tri-state control signals from the core of the device before they are passed to the PURESPEED I/O buffers. The block contains a register for SDR operation and a group of three registers for DDR and shift register operation. The output signal tri-state control signal (TO) can be derived directly from one of the inputs (bypass mode), the SDR shift register, the DDR registers or the data associated with the buffer (for open drain emulation). Figure 2-24 shows the diagram of the Tristate Register Block.

Tristate SDR Register/Latch Block

The SDR register operates on the positive edge of the high-speed clock. In it has a variety of programmable options for set/reset including, set or reset, asynchronous or synchronous Local Set Reset LSR and Global Set Reset GSR enable or disable. The register LSR input is driven from LSRO, which is generated from the PIO control MUX. The GSR input is driven from the GSR output of the PIO control MUX, which allows the global set-reset to be disabled on a PIO basis.

Tristate DDR/Shift Register Block

The DDR/Shift block is shared with the output block allowing DDR support using the high-speed clock and the associated transfer from the low-speed clock domain. It functions as a gearbox allowing low-speed parallel data from the FPGA fabric to provide a high-speed tri-state control stream.

There is a special mode for DDR-II memory interfaces where the termination is controlled by the output tristate signal. During WRITE cycle when the FPGA is driving the lines, the parallel terminations are turned off. During READ cycle when the FPGA is receiving data, the parallel terminations are turned on.

I/O Architecture Rules

Table 2-6 shows the PIO usage for x1, x2, x4 gearing. The checkmarks in the columns show the specific PIOs that are used for each gearing mode. When using x2 or x4 gearing, any PIO which is not used for gearing can still be used as an output.

Bank6	60	84	96	132	156
Bank7	28	36	60	96	136

Note: Not all the I/Os of the Banks are available in all the packages

The LatticeSC devices contain three types of PURESPEED I/O buffers:

1. **Left and Right Sides (Banks 2, 3, 6 and 7)**

These buffers can support LVCMOS standards up to 2.5V. A differential output driver (for LVDS and RSFS) is provided on all primary PIO pairs (A and B) and differential receivers are available on all pairs. Complimentary drivers are available. Adaptive input logic is available on PIOs A or C.

2. **Top Side (Bank 1)**

These buffers can support LVCMOS standards up to 3.3V, including PCI33, PCI-X33 and SSTL-33. Differential receivers are provided on all PIO pairs but differential drivers for LVDS and RSFS are not available. Adaptive input logic is not available on this side. Complimentary output drivers are available.

Density Shifting

The LatticeSC family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

Signal Descriptions

Signal Name	I/O	Description
General Purpose		
P[Edge] [Row/Column Number*]_[A/B/C/D]	I/O	<p>[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).</p> <p>[Row/Column Number] indicates the PIC row or the column of the device on which the PIC exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.</p> <p>[A/B/C/D] indicates the PIO within the PIC to which the pad is connected.</p> <p>Some of these user programmable pins are shared with special function pins. These pin when not used as special purpose pins can be programmed as I/Os for user logic.</p> <p>During configuration the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.</p>
VREF1_x, VREF2_x	—	The reference supply pins for I/O bank x. Any I/O pin in a bank can be assigned as a reference supply pin, but software defaults use designated pin.
NC	—	No connect. NC pins should not be connected to any active signals, VCC or GND.
Non-SERDES Power Supplies		
VCCIOx	—	VCCIO - The power supply pins for I/O bank x. Dedicated pins.
VCC12 ¹	—	1.2V supply for configuration logic, PLLs and SERDES Rx, Tx and PLL. All VCC12 pins must be connected. As VCC12 supplies power for analog circuitry, VCC12 should be quiet and isolated from noisy digital board supplies.
VTT_x	—	Termination voltage for bank x. When VTT termination is not required, or used to provide the common mode termination voltage (VCMT), these pins can be left unconnected on the device. VCMT function is not used in the bank. If the internal or external VCMT function for differential input termination is used, the VTT pins should be unconnected and allowed to float.
GND	—	GND - Ground. Dedicated pins. All grounds must be electrically connected at the board level.
VCC	—	VCC - The power supply pins for core logic. Dedicated pins (1.2V/1.0V).
VCCAUX	—	VCCAUX - Auxiliary power supply pin - powers all differential and referenced input buffers. Dedicated pins (2.5V).
VCCJ	—	VCCJ - The power supply pin for JTAG Test Access Port.
PROBE_VCC	—	VCC signal - Connected to internal VCC node. Can be used for feedback to control an external board power converter. Can be unconnected if not used.

Signal Descriptions (Cont.)

Signal Name	I/O	Description
RESP_[ULC/URC]	—	Calibration resistor to be placed between this pin and either ground or RESPN_[ULC/URC]. RESPN_[ULC/URC] is available on select packages. If available, connection of calibration resistor between RESP_[ULC/URC] and RESPN_[ULC/URC] takes precedence over connection of calibration resistor between RESP_[ULC/URC] and ground. Note: only one per side of the device. Value: 4.02K ohm +/- 1% ohm.
RESPN_[ULC/URC]	—	Available on selected packages. If available, calibration resistor should be placed between RESP_[ULC/URC] and RESPN_[ULC/URC] instead of between RESP_[ULC/URC] and ground. Note: only one per side of the device. Value: 4.02K ohm +/- 1% ohm.
[A:D]_VDDIBx_[L/R]	—	Input buffer power supply for channel x (1.2V/1.5V) on left [L] or right [R] side of device.
[A:D]_VDDOBx_[L/R]	—	Output buffer power supply for channel x (1.2V/1.5V) on left [L] or right [R] side of device.
[A:D]_VDDAX25_[L/R]	—	Auxiliary power for input and output termination (2.5V) on left [L] or right [R] side of device.

1. The ispLEVER software tools may specify VDDR_X, VD_{DTX}, VD_{DP} and VC_{CL} pins. These pins should be considered VCC12 pins.
Note: Signals listed as Signal A / Signal B define the same physical pin that is used for different functions based on configuration mode.
