

Welcome to [E-XFL.COM](#)

### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

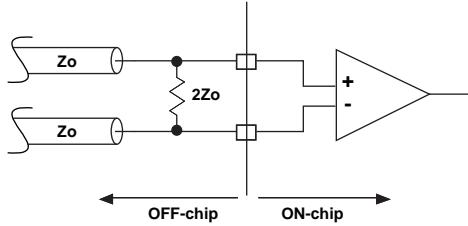

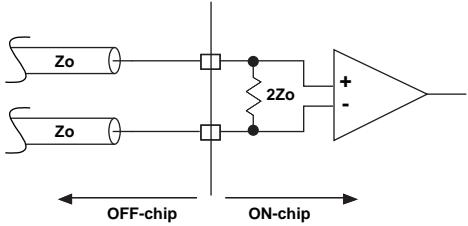

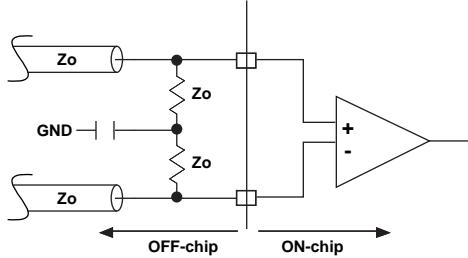

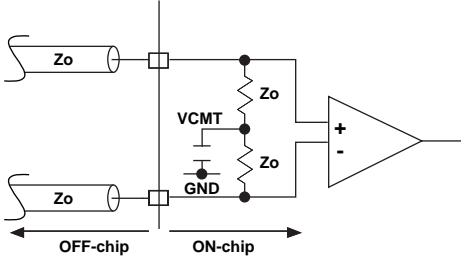

Product Status	Obsolete
Number of LABs/CLBs	6250
Number of Logic Elements/Cells	25000
Total RAM Bits	1966080
Number of I/O	476
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 105°C (TJ)
Package / Case	1020-BBGA, FCBGA
Supplier Device Package	1020-OFcBGA Rev 2 (33x33)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga25ep1-6ffa1020i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga25ep1-6ffa1020i</a>

**Differential Input Termination**

The LatticeSC device allows two types of differential termination. The first is a single resistor across the differential inputs. The second is a center-tapped system where each input is terminated to the on-chip termination bus  $V_{CMT}$ . The  $V_{CMT}$  bus is DC-coupled through an internal capacitor to ground.

Figure 2-29 shows the differential termination schemes and Table 2-9 shows the nominal values of the termination resistors.

**Figure 2-29. Differential Termination Scheme**

Termination Type	Discrete Off-Chip Solution	Lattice On-Chip Solution
Differential termination		
Differential and common mode termination		

**Calibration**

There are two calibration sources that are associated with the termination scheme used in the LatticeSC devices:

- DIFFR – This pin occurs in each bank that supports differential drivers and must be connected through a  $1K\pm 1\%$  resistor to ground if differential outputs are used. Note that differential drivers are not supported in banks 1, 4 and 5.
- XRES – There is one of these pins per device. It is used for several functions including calibrating on-chip termination. This pin should always be connected through a  $1K\pm 1\%$  resistor to ground.

The LatticeSC devices support two modes of calibration:

- Continuous – In this mode the SC devices continually calibrate the termination resistances. Calibration happens several times a second. Using this mode ensures that termination resistances remain calibrated as the silicon junction temperature changes.
- User Request – In this mode the calibration circuit operates continuously. However, the termination resistor values are only updated on the assertion of the calibration\_update signal available to the core logic.

For more information on calibration, refer to the details of additional technical documentation at the end of this data sheet.

**Hot Socketing**

The LatticeSC devices have been carefully designed to ensure predictable behavior during power-up and power-down. To ensure proper power sequencing, care must be taken during power-up and power-down as described below. During power-up and power-down sequences, the I/Os remain in tristate until the power supply voltage is high enough to ensure reliable operation. In addition, leakage into I/O pins is controlled to within specified limits,

flexiPCS quads are not dedicated solely to industry standard protocols. Each quad (and each channel within a quad) can be programmed for many user defined data manipulation modes. For example, modes governing user-defined word alignment and multi-channel alignment can be programmed for non-standard protocol applications.

For more information on the functions and use of the flexiPCS, refer to the [LatticeSC/M Family flexiPCS Data Sheet](#).

## System Bus

Each LatticeSC device connects the FPGA elements with a standardized bus framework referred to as a System Bus. Multiple bus masters optimize system performance by sharing resources between different bus masters such as the MPI and configuration logic. The wide data bus configuration of 32 bits with 4-bit parity supports high-bandwidth, data intensive applications.

There are two types of interfaces on the System Bus, master and slave. A master interface has the ability to perform actions on the bus, such as writes and reads to and from a specific address. A slave interface responds to the actions of a master by accepting data and address on a write and providing data on a read. The System Bus has a memory map which describes each of the slave peripherals that is connected on the bus. Using the addresses listed in the memory map, a master interface can access each of the slave peripherals on the System Bus. Any and all peripherals on the System Bus can be used at the same time. Table 2-12 list all of the available user peripherals on the System Bus after device power-up.

**Table 2-12. System Bus User Peripherals**

Peripheral	Name	Interface Type
Micro Processor Interface	MPI	Master
User Master Interface	UMI	Master
User Slave Interface	USI	Slave
Serial Management Interface (PLL, DLL, User Logic)	SMI	Slave
Physical Coding Sublayer	PCS	Slave
Direct FPGA Access	DFA	Slave

The peripherals listed in Table 2-12 can be added when the System Bus module is created using Module IP/Manager (ispLEVER Module/IP Manager).

Figure 2-31 also lists the existing peripherals on the System Bus. The gray boxes are available only during configuration. Refer to Lattice technical note TN1080, [LatticeSC sysCONFIG Usage Guide](#), for configuration options. The Status and Config box refers to internal System Bus registers. This document presents all the interfaces listed in Table 2-12 in detail to help the user utilize the desired functions of the System Bus.

**LatticeSC/M Internal Timing Parameters<sup>1</sup> (Continued)**

Over Recommended Commercial Operating Conditions at VCC = 1.2V +/- 5%

Parameter	Symbol	Description	-7		-6		-5		Units
			Min.	Max.	Min.	Max.	Min.	Max.	
<b>EBR Timing</b>									
t <sub>CO_EBR</sub>	CK_Q_DEL	Clock (Read) to output from Address or Data	—	1.900	—	2.116	—	2.335	ns
t <sub>COO_EBR</sub>	CK_Q_DEL	Clock (Write) to output from EBR output Register	0.390	—	0.444	—	0.498	—	ns
t <sub>SUDATA_EBR</sub>	D_CK_SET	Setup Data to EBR Memory (Write clk)	-0.173	—	-0.192	—	-0.210	—	ns
t <sub>HDATA_EBR</sub>	D_CK_HLD	Hold Data to EBR Memory (Write clk)	0.276	—	0.305	—	0.335	—	ns
t <sub>SUADDR_EBR</sub>	A_CK_SET	Setup Address to EBR Memory (Write clk)	-0.165	—	-0.182	—	-0.200	—	ns
t <sub>HADDR_EBR</sub>	A_CK_HLD	Hold Address to EBR Memory (Write clk)	0.269	—	0.298	—	0.327	—	ns
t <sub>SUWREN_EBR</sub>	CE_CK_SET	Setup Write/Read Enable to EBR Memory (Write/Read clk)	0.225	—	0.226	—	0.226	—	ns
t <sub>HWREN_EBR</sub>	CE_CK_HLD	Hold Write/Read Enable to EBR Memory (write/read clk)	0.073	—	0.095	—	0.116	—	ns
t <sub>SUCE_EBR</sub>	CS_CK_SET	Clock Enable Setup Time to EBR Output Register (Read clk)	0.261	—	0.269	—	0.276	—	ns
t <sub>HCE_EBR</sub>	CS_CK_HLD	Clock Enable Hold Time to EBR Output Register (Read clk)	0.023	—	0.039	—	0.055	—	ns
t <sub>RSTO_EBR</sub>	RESET_Q_DEL	Reset To Output Delay Time from EBR Output Register (asynchronous)	—	0.589	—	0.673	—	0.757	ns
<b>Cycle Boosting Timing</b>									
t <sub>DEL1</sub>	DEL1	Cycle boosting delay 1 applies to PIO, PFU, EBR	—	0.480	—	0.524	—	0.570	ns
t <sub>DEL2</sub>	DEL2	Cycle boosting delay 2 applies to PIO, PFU, EBR	—	0.922	—	1.005	—	1.090	ns
t <sub>DEL3</sub>	DEL3	Cycle boosting delay 3 applies to PIO, PFU, EBR	—	1.366	—	1.488	—	1.612	ns

1. Complete timing parameters for a user design will be incorporated when running ispLEVER. This is a sampling of the key timing parameters.

**Input Delay Block/AIL Timing**

Parameter	Description	Min.	Typ.	Max.	Units
$t_{FDEL}$	Fine delay time	35	45	80	ps
$t_{CDEL}$	Coarse delay time	1120	1440	2560	ps
$j_{t_{AIL}}$	AIL jitter tolerance	1 - ((N <sup>1</sup> * $t_{FDEL}$ ) / (Clock Period))			UI

1. N = number of fine delays used in a particular AIL setting

**GSR Timing**

Parameter	Description	VCC	-7		-6		-5		Units
			Min.	Max.	Min.	Max.	Min.	Max.	
$t_{SYNC\_GSR\_MAX}$	Maximum operating frequency for synchronous GSR	1.14V	—	438	—	417	—	398	MHz
		0.95V	—	378	—	355	—	337	MHz
$t_{ASYNC\_GSR\_MPW}$	Minimum pulse width of asynchronous input	—	—	—	—	—	3.3	—	ns

Note: Synchronous GSR goes out of reset in two cycles from the clock edge where the setup time of the FF was met.

**Internal System Bus Timing**

Parameter	Description	-7		-6		-5		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
$t_{HCLK}$	Maximum operating frequency for internal system bus HCLK.	—	200	—	200	—	200	MHz

Note: There is no minimum frequency. If HCLK is sourced from the embedded oscillator, the minimum frequency limitation of the oscillator/divider is about 0.3 MHz. Refer to the oscillator data for missing configuration modes.

**Signal Descriptions (Cont.)**

Signal Name	I/O	Description
RESETN		Reset. (Also sent to general routing). During configuration it resets the configuration state machine. After configuration this pin can perform the global set/reset (GSR) functions or can be used as a general input pin.
CFGIRQN	O	MPI Interrupt request active low signal is controlled by system bus interrupt controller and may be sourced from any bus error or MPI configuration error. It can be connected to one of MPC860 IRQ pins.
TSALLN	I	Tristates all I/O.
<b>Configuration Pads (User I/O if not used. Used during sysCONFIG.)</b>		
HDC/SI	O	<p>High During Configuration is output high until configuration is complete. It is used as a control output, indicating that configuration is not complete.</p> <p>For SPI modes, this pin is used to download the read command and initial read address into the Flash memory device on the falling edge of SCK. This pin will be connected to SI of the memory. If the SPI mode is used, the 8-bit instruction code 0x03 will be downloaded followed by a 24-bit starting address of 0x000000 or a non-zero stat address for partial reconfiguration. If the SPIX mode has been selected, the 8-bit instruction captured on D[7:0] at power-up will be shifted in and followed by a 32-bit starting address of 0x000000.</p>
LDCN/SCS	O	<p>Low During Configuration is output low until configuration is complete. It is used as a control output, indicating that configuration is not complete.</p> <p>For SPI modes, this is an active low chip select for Flash memories. It will go active after INITN goes high but before SCK begins. During power up LDCN will be low. Once INITN goes high, LDCN will go high for 100ns-200ns after which time it will go back low and configuration can begin. During the 100ns-200ns period, the read instruction will be latched for SPIX mode.</p>
DOUT	O	Serial data output that can drive the D0/DIN of daisy-chained slave devices. The data-stream from this output will propagate preamble bits of the bitstream to daisy-chained devices. Data out on DOUT changes on the rising edge of CCLK.
QOUT/CEON	O	<p>During daisy-chaining configuration, QOUT is the serial data output that can drive the D0/DIN of daisy-chained slave devices that do not propagate preamble bits. Data out on QOUT changes on the rising edge of CCLK.</p> <p>During parallel-chaining configuration, active low CEON enables the cascaded slave device to receive bitstream data.</p>
RDN	I	Used in the asynchronous peripheral configuration mode. A low on RDN changes D[7:3] into status outputs. WRN and RDN should not be used simultaneously. If they are, the write strobe overrides.
WRN	I	When the FPGA is selected, a low on the write strobe, WRN, loads the data on D[7:0] inputs into an internal data buffer.
CS0N CS1	I	Used in the asynchronous peripheral, slave parallel and MPI modes. The FPGA is selected when CS0N is low and CS1 is high. During configuration, a pull-up is enabled on both except with MPI DMA access control.
A[21:0]	I/O	In master parallel mode, A[21:0] is an output and will address the configuration EPROMs up to 4 MB space. For MPI configuration mode, A[17:0] will be the MPI address MPI_ADDR[31:14], A[19:18] will be the transfer size and A[21:20] will be the burst mode and burst in process.

Date	Version	Section	Change Summary
September 2007	01.7	Pinout Information	Added Thermal Management text section.
		Supplemental Information	Updated title list.
November 2007	01.8	Ordering Information	Removed -7 speed grade information for 115K LUT devices in the Ordering Information tables.
January 2008	01.9	Introduction	Corrections/Additions to memory controller list (Tables 1-2).
		Architecture	AIL Overview – Modified power used by AIL block. PURESPEED I/O Buffer Banks – Modified VTT termination info. Added info about complimentary drivers for all banks. Supported Source Synchronous Interfaces – Modified data for DDRII in Table 2-11.
			Recommended Operating Conditions – Changed footnote 3.
			Initialization and Standby Supply Current – Inserted a paragraph with info regarding the table. Also updated the table.
			Typical Building Block Function Performance – Added VCC=1.2V=1.2V+/-5% above Pin to Pin Performance table.
			LatticeSC External Switching Characteristics – Added VCC=1.2V=1.2V+/-5% above table. Reworded footnote 3.
			LatticeSC Family Timing Adders – Added VCC=1.2V=1.2V+/-5% above table.
			LatticeSC Internal Timing Parameters – Added VCC=1.2V=1.2V+/-5% above table. Reworded footnote 1.
			GSR Timing – Added a new table for Internal System Bus Timing after GSR Timing.
			LatticeSC sysCONFIG Port Timing – Corrected sysCONFIG SPI Port information.
March 2008	02.0	DC and Switching Characteristics	Pinout Information – Signal Descriptions – Modified info for VTT_X, PROBE_VCC, and PROBE_GND. Modified info for [LOC]_DLL[T,C]_IN[C,D,E,F].
			Supplemental Information – Updated list of technical notes, added reference to LatticeSC/M flexiPCS Data Sheet.
			Updated Internal Timing Parameters table. Updated Read Mode timing diagram. Updated Read Mode with Input Registers Only timing diagram.
June 2008	02.1	—	Data sheet status changed from preliminary to final.
		Architecture	Removed Read-Before-Write sysMEM EBR mode.
		DC and Switching Characteristics	Updated LatticeSC/M External Switching Characteristics table.
			Updated LatticeSC/M Internal Timing Parameters table.
			Removed Read-Before-Write sysMEM EBR mode.
December 2008	02.2	Architecture	Output/Tristate DDR/Shift Register Block Diagram - corrected connection to POS.
		DC and Switching Characteristics	DC and Switching Characteristics table - updated data for t <sub>SUIPIO</sub> .
			Added T <sub>R</sub> , T <sub>F</sub> parameter to PURESPEED I/O Differential Electrical Characteristics (LVDS) table.
		Multiple	Removed references to HyperTransport throughout the data sheet.
January 2010	02.3	Introduction	Updated per PCN #01A-10 (ceramic fcBGA conversion to organic fcBGA for the 1152-ball and 1704-ball fcBGA packages) and PCN #02A-10 (1020-ball organic fcBGA conversion to 1020-ball organic fcBGA revision 2 package).
		Ordering Information
