Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

2. Requires two PFUs.

Single Ended Inputs: The SC devices support a number of different termination schemes for single ended inputs:

- Parallel to V_{CCIO} or GND
- Parallel to $V_{CCIO}/2$
- Parallel to V_{TT}

Figure 2-28 shows the single ended input schemes that are supported. The nominal values of the termination resistors are shown in Table 2-9.

Figure 2-28. Input Termination Schemes

Termination Type	Discrete Off-Chip Solution	Lattice On-Chip Solution
Parallel termination to to V_{CCIO}, or parallel to GND receiving end		Parallel termination to $V_{CCIO}/2$ receiving end		Parallel termination to V_{TT} at receiving end		
In many situations designers can chose whether to use Thevenin or parallel to V_{TT} termination. The Thevenin approach has the benefit of not requiring a termination voltage to be applied to the device. The parallel to V_{TT} approach consumes less power.

VTT Termination Resources

Each I/O bank, except bank 1, has a number of V_{TT} pins that must be connected if V_{TT} is used. Note V_{TT} pins can sink or source current and the power supply they are connected to must be able to handle the relatively high currents associated with the termination circuits. Note: V_{TT} is not available in all package styles.

On-chip parallel termination to V_{TT} is supported at the receiving end only. On-chip parallel output termination to V_{TT} is not supported.

The V_{TT} internal bus is also connected to the internal V_{CMT} node. Thus in one bank designers can implement either V_{TT} termination or V_{CMT} termination for differential inputs.

DDRII/RLDRAMII Termination Support

The DDR II memory and RLDRAMII (in Bidirection Data mode) standards require that the on-chip termination to V_{TT} be turned on when a pin is an input and off when the pin is an output. The LatticeSC devices contain the required circuitry to support this behavior. For additional detail refer to technical information at the end of the data sheet.

Signal Descriptions (Cont.)

Signal Name	I/O	Description
D[n:0]	I/O	In parallel configuration modes, D[7:0] receives configuration data, and each pin is pull-up enabled. For slave serial mode, D0 is the data input. D[7:3] is the output internal status for peripheral mode when RDN is low. D[7:0] is also the first byte of MPI data pins. In MPI configuration mode, MPI selectable data bus width from 8 and 16-bit. Driven by a bus master in a write transaction. Driven by MPI in a read transaction.
DP[m:0]	I/O	MPI selectable parity data bus width from 1, 2, and 3-bit DP[0] for D[7:0], DP[1] for D[15:8], and DP[2] for D[23:16].
BUSYN/RCLK/SCK	O	During configuration in peripheral mode, high on BUSYN indicates another byte can be written to the FPGA. If a read operation is done when the device is selected, the same status is also available on D[7] in asynchronous peripheral mode. During configuration in slave parallel mode, low on BUSYN inhibits the external host from sending new data. The output is used by slave parallel and master serial modes only for decompression. During configuration in master parallel and master byte modes, RCLK is a read clock output signal to an external memory. The RCLK frequency is the same as CCLK when used with uncompressed bitstreams. RCLK will be 1/8 the frequency of CCLK when the bitstream is compressed. During configuration in SPI modes, SCK is generated by the device and connected to the CLK input of the FLASH memory.
MPI Interface (Dedicated pin)		
MPI_IRQ_N	O	MPI Interrupt request active low signal is controlled by system bus interrupt controller and may be sourced from any bus error or MPI configuration error. It can be connected to one of MPC860 IRQ pins.
MPI Interface (User I/O if MPI is not used.)		
MPI_CS0N MPI_CS1	I	MPI chip select pins, active low on MPI_CS0N while active high on MPI_CS1. Both have to be active during the whole transfer data phase. During transfer address phase, both can be inactive so that the decoding for them from address can be slow. If they are active during address phase, one cycle can be saved for sync read.
MPI_CLK	I	This is the PowerPC bus clock. It can be a source of the clock for embedded system bus. If MPI_CLK is used as system bus clock, MPI will be set into sync mode by default. All of the operation on PowerPC side of MPI are synchronized to the rising edge of this clock.
MPI_TSIZ[1:0]	I	Driven by a bus master to indicate the data transfer size for the transaction. 01 for byte, 10 for half-word, and 00 for word.
MPI_WR_N	I	Driven high indicates that a read access is in progress. Driven low indicates that a write access is in process.
MPI_BURST	I	Driven active low indicates that a burst transfer is in progress. Driven high indicates that the current transfer is not a burst.
MPI_BDIP	I	Active low “Burst Data in Process” is driven by a PowerPC processor. Asserted indicates that the second beat in front of the current one is requested by the master. Negated before the burst transfer ends to abort the burst data phase.

Date	Version	Section	Change Summary
September 2007	01.7	Pinout Information	Added Thermal Management text section.
		Supplemental Information	Updated title list.
November 2007	01.8	Ordering Information	Removed -7 speed grade information for 115K LUT devices in the Ordering Information tables.
January 2008	01.9	Introduction	Corrections/Additions to memory controller list (Tables 1-2).
		Architecture	AIL Overview – Modified power used by AIL block.
			PURESPEED I/O Buffer Banks – Modified VTT termination info. Added info about complimentary drivers for all banks.
			Supported Source Synchronous Interfaces – Modified data for DDRII in Table 2-11.
		DC and Switching Characteristics	Recommended Operating Conditions – Changed footnote 3.
			Initialization and Standby Supply Current – Inserted a paragraph with info regarding the table. Also updated the table.
			Typical Building Block Function Performance – Added VCC=1.2V=1.2V+/-5% above Pin to Pin Performance table.
			LatticeSC External Switching Characteristics – Added VCC=1.2V=1.2V+/-5% above table. Reworded footnote 3.
			LatticeSC Family Timing Adders – Added VCC=1.2V=1.2V+/-5% above table.
			LatticeSC Internal Timing Parameters – Added VCC=1.2V=1.2V+/-5% above table. Reworded footnote 1.
			GSR Timing – Added a new table for Internal System Bus Timing after GSR Timing.
			LatticeSC sysCONFIG Port Timing – Corrected sysCONFIG SPI Port information.
		Pinout Information	Signal Descriptions – Modified info for VTT_x, PROBE_VCC, and PROBE_GND. Modified info for [LOC]_DLL[T,C]_IN[C,D,E,F].
		Supplemental Information	Updated list of technical notes, added reference to LatticeSC/M flexiPCS Data Sheet.
March 2008	02.0	DC and Switching Characteristics	Updated Internal Timing Parameters table.
			Updated Read Mode timing diagram.
			Updated Read Mode with Input Registers Only timing diagram.
June 2008	02.1	—	Data sheet status changed from preliminary to final.
		Architecture	Removed Read-Before-Write sysMEM EBR mode.
		DC and Switching Characteristics	Updated LatticeSC/M External Switching Characteristics table.
			Updated LatticeSC/M Internal Timing Parameters table.
			Removed Read-Before-Write sysMEM EBR mode.
December 2008	02.2	Architecture	Output/Tristate DDR/Shift Register Block Diagram - corrected connection to POS.
		DC and Switching Characteristics	DC and Switching Characteristics table - updated data for $t_{SUI\_PIO.}$
			Added $T_{R,}$ T_F parameter to PURESPEED I/O Differential Electrical Characteristics (LVDS) table.
		Multiple	Removed references to HyperTransport throughout the data sheet.
January 2010	02.3	Introduction	Updated per PCN #01A-10 (ceramic fcBGA conversion to organic fcBGA for the 1152-ball and 1704-ball fcBGA packages) and PCN #02A-10 (1020-ball organic fcBGA conversion to 1020-ball organic fcBGA revision 2 package).
