Understanding Embedded - FPGAs (Field Programmable Gate Array)

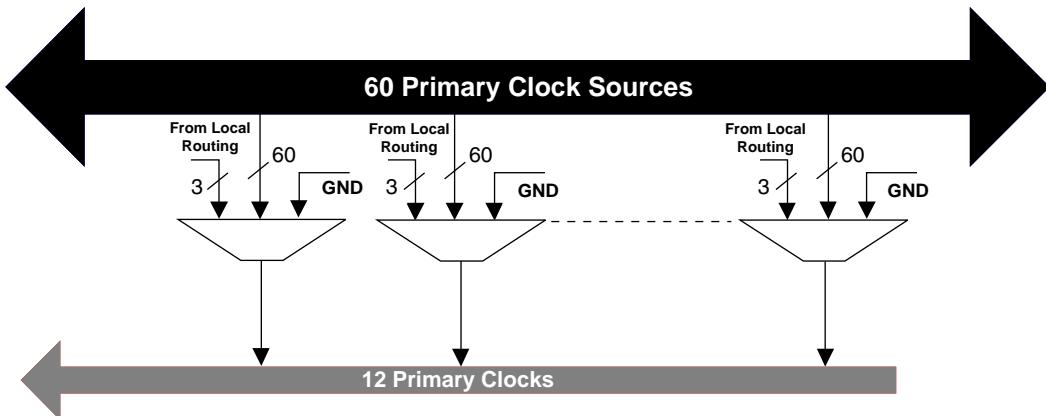

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Note: GND is available to switch off the network.

Secondary Clocks

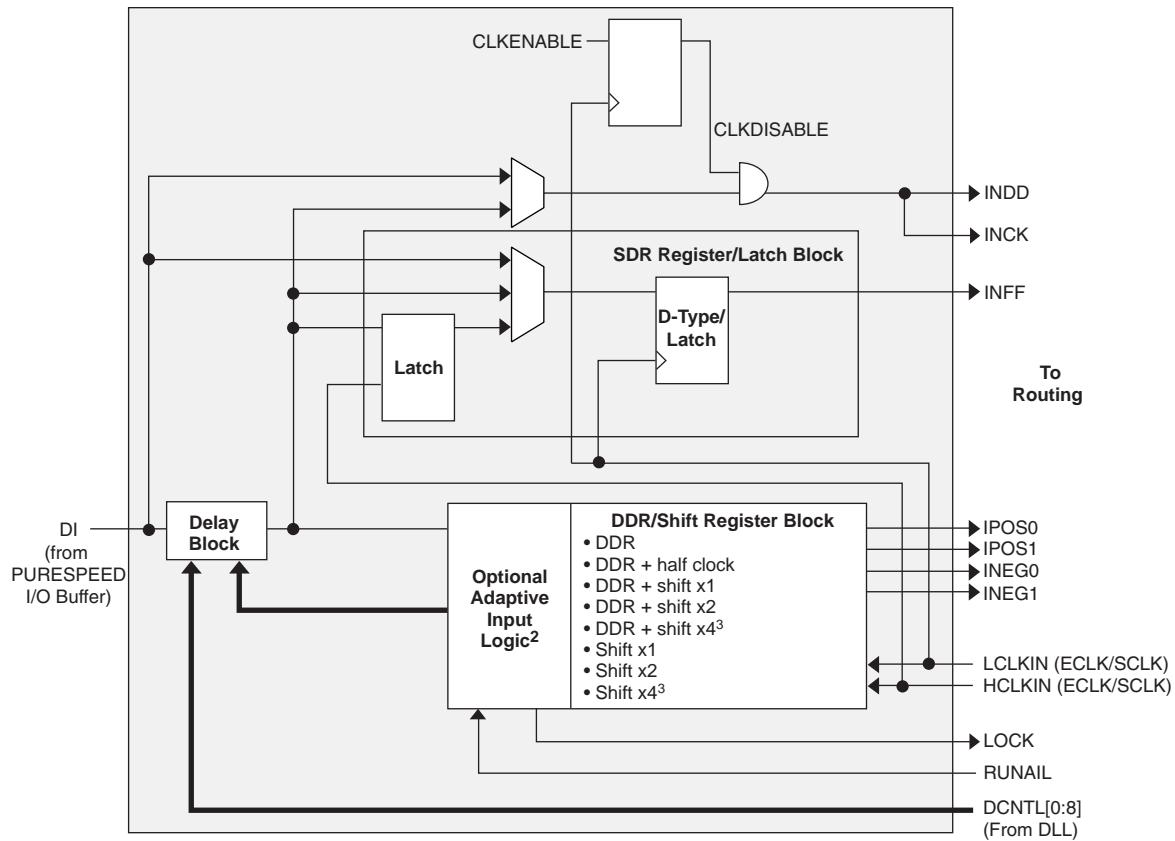

In addition to the primary clock network and edge clocks the LatticeSC devices also contain a secondary clock network. Built of X6 style routing elements this secondary clock network is ideal for routing slower speed clock and control signals throughout the device preserving high-speed clock networks for the most timing critical signals.

Edge Clocks

LatticeSC devices have a number of high-speed edge clocks that are intended for use with the PIOs in the implementation of high-speed interfaces. There are eight edge clocks per bank for the top and bottom of the device. The left and right sides have eight edge clocks per side for both banks located on that side. Figure 2-7 shows the arrangement of edge clocks.

Edge clock resources can be driven from a variety of sources. Edge clock resources can be driven from:

- Edge clock PIOs in the same bank
- Primary clock PIOs in the same bank
- Routing
- Adjacent PLLs and DLLs
- ELSR output from the clock divider

Figure 2-20. Input Register Block¹

1. UPDATE, Set and Reset not shown for clarity

2. Adaptive input logic is only available in selected PIO

3. By four shift modes utilize DDR/shift register block from paired PIO.

4. CLKDISABLE is used to block the transitions on the DQS pin during post-amble. Its main use is to disable DQS (typically found in DDR memory interfaces) or other clock signals. It can also be used to disable any/all input signals to save power.

1. D refers to open drain capability.

2. User can select either drive current or driver impedances but not both.

3. Emulated with external resistors.

4. No GTL or GTL+ support.

PCI Clamp

A programmable PCI clamp is available on the top and bottom banks of the device. The PCI clamp can be turned “ON” or “OFF” on each pin independently. The PCI clamp is used when implementing a 3.3V PCI interface. The

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.

2. T_A 25°C, $f = 1.0\text{MHz}$

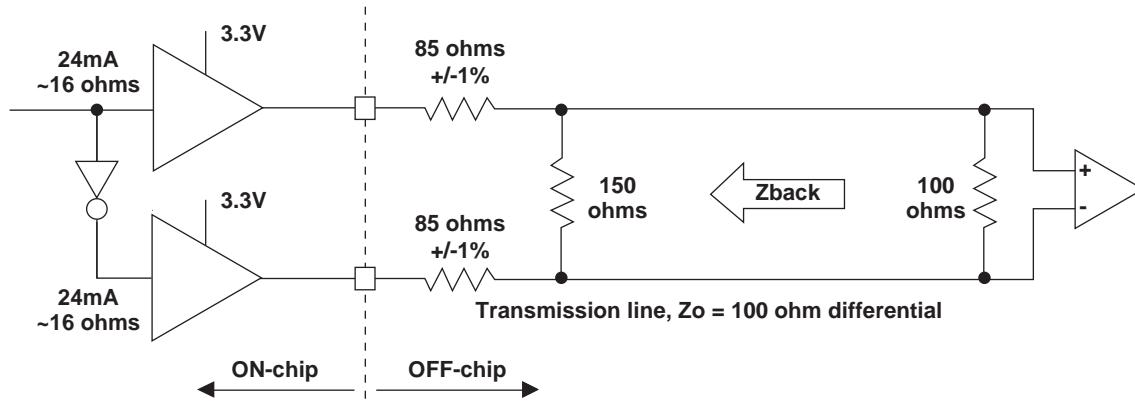

3. I_{PU} , I_{PD} , I_{BHLS} and I_{BHHS} have minimum values of 15 or -15 μA if V_{CCIO} is set to 1.2V nominal.

4. This table does not apply to SERDES pins.

5. For programmable I/Os.

LVPECL

The LatticeSC devices support differential LVPECL standard. This standard is emulated using controlled impedance complementary LVCMOS outputs in conjunction with a parallel resistor across the driver outputs. The scheme shown in Figure 3-3 is one possible solution for point-to-point signals.
