

Welcome to [E-XFL.COM](#)

## [Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

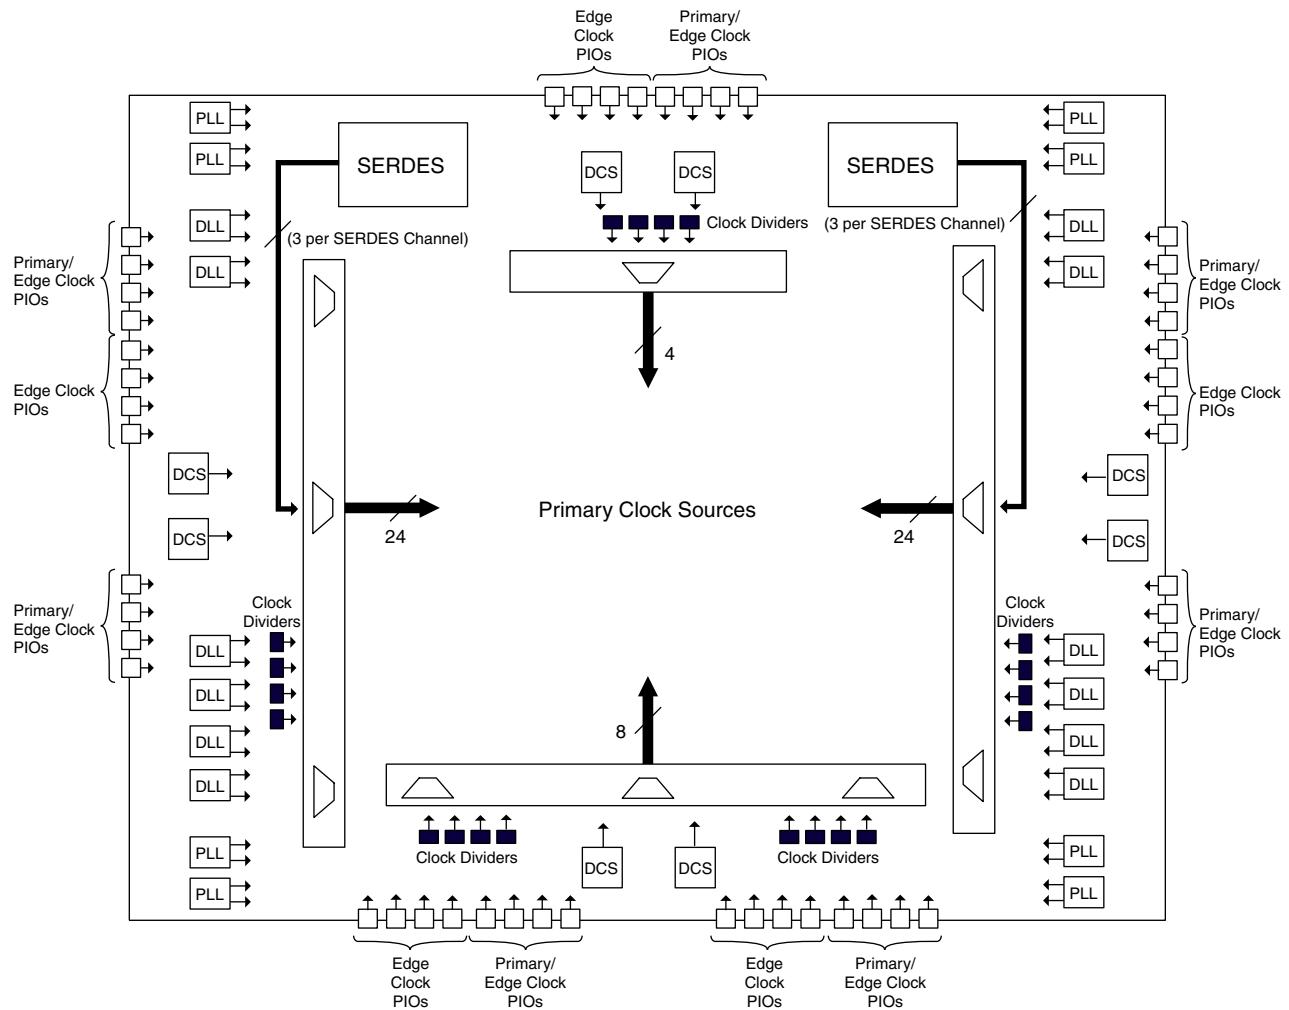

### **Details**

|                                |   |
|--------------------------------|---|
| Product Status                 | Obsolete  |
| Number of LABs/CLBs            | 10000   |
| Number of Logic Elements/Cells | 40000   |
| Total RAM Bits                 | 4075520   |
| Number of I/O                  | 562   |
| Number of Gates                | -   |
| Voltage - Supply               | 0.95V ~ 1.26V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | 0°C ~ 85°C (TJ)   |
| Package / Case                 | 1020-BBGA, FCBGA  |
| Supplier Device Package        | 1020-OFcBGA Rev 2 (33x33)   |
| Purchase URL                   | <a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga40ep1-6ffan1020c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga40ep1-6ffan1020c</a> |

- Two outputs per PLL
- Clock divider outputs
- Digital Clock Select (DCS) block outputs
- Three outputs per SERDES quad

Figure 2-5 shows the arrangement of the primary clock sources.

**Figure 2-5. Clock Sources**

### Primary Clock Routing

The clock routing structure in LatticeSC devices consists of 12 Primary Clock lines per quadrant. The primary clocks are generated from 64:1 MUXes located in each quadrant. Three of the inputs to each 64:1 MUX comes from local routing, one is connected to GND and rest of the 60 inputs are from the primary clock sources. Figure 2-6 shows this clock routing.

PCI Specification, Revision 2.2 requires the use of clamping diodes for 3.3V operation. For more information on the PCI interface, please refer to the PCI Specification, Revision 2.2.

### Programmable Slew Rate Control

All output and bidirectional buffers have an optional programmable output slew rate control that can be configured for either low noise or high-speed performance. Each I/O pin has an individual slew rate control. This allows designers to specify slew rate control on a pin-by-pin basis. This slew rate control affects both the rising and falling edges.

### Programmable Termination

Many of the I/O standards supported by the LatticeSC devices require termination at the transmitter, receiver or both. The SC devices provide the capability to implement many kinds of termination on-chip, minimizing stub lengths and hence improving performance. Utilizing this feature also has the benefit of reducing the number of discrete components required on the circuit board. The termination schemes can be split into two categories single-ended and differential.

#### Single Ended Termination

**Single Ended Outputs:** The SC devices support a number of different terminations for single ended outputs:

- Series
- Parallel to  $V_{CCIO}$  or GND
- Parallel to  $V_{CCIO}/2$
- Parallel to  $V_{CCIO}/2$  combined with series

Figure 2-27 shows the single ended output schemes that are supported. The nominal values of the termination resistors are shown in Table 2-10.

this allows for easy integration with the rest of the system. These capabilities make the LatticeSC ideal for many multiple power supply and hot-swap applications. The maximum current during hot socketing is 4mA. See Hot Socketing Specifications in Chapter 3 of this data sheet.

## Power-Up Requirements

To prevent high power supply and input pin currents, each VCC, VCC12, VCCAUX, VCCIO and VCCJ power supplies must have a monotonic ramp up time of 75 ms or less to reach its minimum operating voltage. Apart from VCC and VCC12, which have an additional requirement, and VCCIO and VCCAUX, which also have an additional requirement, the VCC, VCC12, VCCAUX, VCCIO and VCCJ power supplies can ramp up in any order, with no restriction on the time between them. However, the ramp time for each must be 75 ms or less. Configuration of the device will not proceed until the last power supply has reached its minimum operating voltage.

### **Additional Requirement for VCC and VCC12:**

VCC12 must always be higher than VCC. This condition must be maintained at ALL times, including during power-up and power-down. Note that for 1.2V only operation, it is advisable to source both of these supplies from the same power supply.

### **Additional Requirement for VCCIO and VCCAUX:**

If any VCCIOs are 1.2/1.5/1.8V, then VCCAUX MUST be applied before them. If any VCCIO is 1.2/1.5/1.8V and is powered up before VCCAUX, then when VCCAUX is powered up, it may drag VCCIO up with it as it crosses through the VCCIO value. (Note: If the VCCIO supply is capable of sinking current, as well as the more usual sourcing capability, this behavior is eliminated. However, the amount of current that the supply needs to sink is unknown and is likely to be in the hundreds of millamps range).

## Power-Down Requirements

To prevent high power supply and input pin currents, power must be removed monotonically from either VCC or VCCAUX (and must reach the power-down trip point of 0.5V for VCC, 0.95V for VCCAUX) before power is removed monotonically from VCC12, any of the VCCIOs, or VCCJ. Note that VCC12 can be removed at the same time as VCC, but it cannot be removed earlier. In many applications, VCC and VCC12 will be sourced from the same power supply and so will be removed together. For systems where disturbance of the user pins is a don't care condition, the power supplies can be removed in any order as long as they power down monotonically within 200ms of each other.

Additionally, if any banks have VCCIO=3.3V nominal (potentially banks 1, 4, 5) then VCCIO for those banks must not be lower than VCCAUX during power-down. The normal variation in ramp-up times of power supplies and voltage regulators is not a concern here.

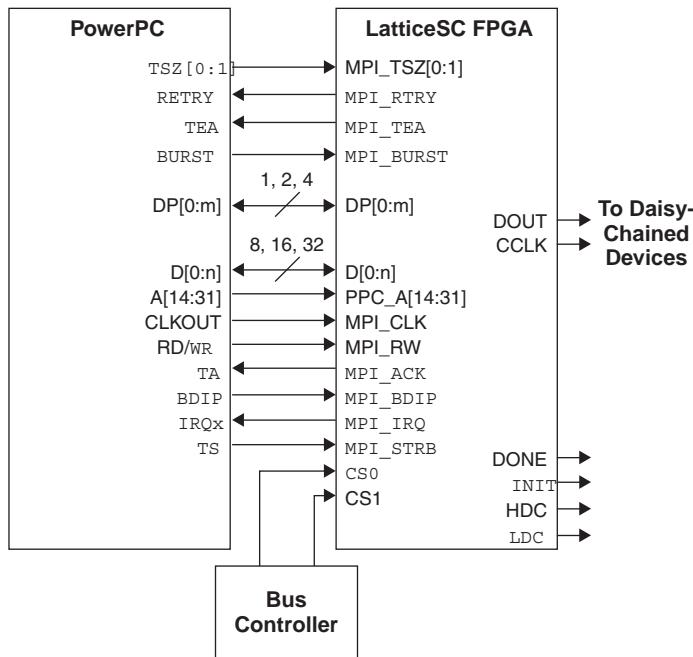

Note: The SERDES power supplies are NOT included in these requirements and have no specific sequencing requirements. However, when using the SERDES with VDDIB or VDDOB that is greater than 1.2V (1.5V nominal for example), the SERDES should not be left in a steady state condition with the 1.5V power applied and the 1.2V power not applied. Both the 1.2V and 1.5V power should be applied to the SERDES at nominally the same time. The normal variation in the ramp-up times of power supplies and voltage regulators is not a concern here.

## SERDES Power Supply Sequencing Requirements

When using the SERDES with 1.5V VDDIB or VDDOB supplies, the SERDES should not be left in a steady state condition with the 1.5V power applied and the 1.2V power not applied. Both the 1.2V and the 1.5V power should be applied to the SERDES at nominally the same time. The normal variation in ramp-up times of power supplies and voltage regulators is not a concern.

### **Additional Requirement for SERDES Power Supply**

All VCC12 pins need to be connected on all devices independent of functionality used on the device. This analog supply is used by both the RX and TX portions of the SERDES and is used to control the core SERDES logic regardless of the SERDES being used in the design. VDDIB and VDDOB are used as supplies for the terminations on the CML input and output buffers. If a particular channel is not used, these can be UNCONNECTED (floating).

**Figure 2-32. PowerPCI and MPI Schematic**

## Configuration and Testing

The following section describes the configuration and testing features of the LatticeSC family of devices.

### IEEE 1149.1-Compliant Boundary Scan Testability

All LatticeSC devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port has its own supply voltage  $V_{CCJ}$  and can operate with LVCMOS33, 25 and 18 standards. For additional detail refer to technical information at the end of the data sheet.

### Device Configuration

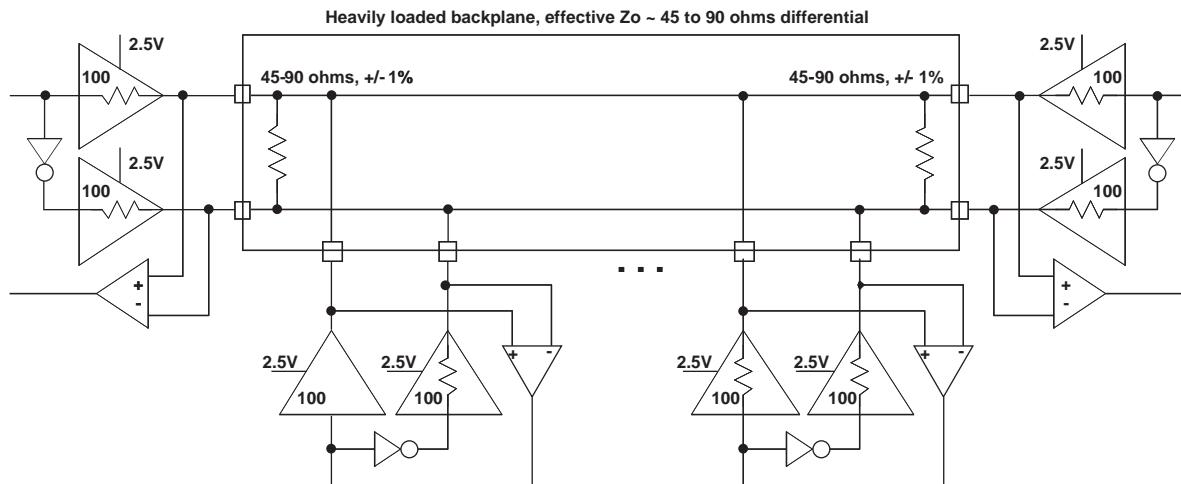

All LatticeSC devices contain three possible ports that can be used for device configuration. The serial port, which supports bit-wide configuration, and the sysCONFIG port that supports both byte-wide and serial configuration. The MPI port supports 8-bit, 16-bit or 32-bit configuration.

The serial port supports both the IEEE Std. 1149.1 Boundary Scan specification and the IEEE Std. 1532 In-System Configuration specification. The sysCONFIG port is a 20-pin interface with six of the I/Os used as dedicated pins and the rest being dual-use pins. When sysCONFIG mode is not used, these dual-use pins are available for general purpose I/O. All I/Os for the sysCONFIG and MPI ports are in I/O bank #1.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port. Once a configuration port is selected, that port is locked and another configuration port cannot be activated until the next re-initialization sequence. For additional detail refer to technical information at the end of the data sheet.

**BLVDS**

The LatticeSC devices support BLVDS standard. This standard is emulated using controlled impedance complementary LVCMOS outputs in conjunction with a parallel external resistor across the driver outputs. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

**Figure 3-2. BLVDS Multi-point Output Example****Table 3-2. BLVDS DC Conditions<sup>1</sup>****Over Recommended Operating Conditions**

| Symbol       | Description                 | Nominal    |            | Units |
|--------------|-----------------------------|------------|------------|-------|
|              |                             | $Z_o = 45$ | $Z_o = 90$ |       |
| $Z_{OUT}$    | Output impedance            | 100        | 100        | ohm   |
| $R_{TLEFT}$  | Left end termination        | 45         | 90         | ohm   |
| $R_{TRIGHT}$ | Right end termination       | 45         | 90         | ohm   |
| $V_{OH}$     | Output high voltage         | 1.375      | 1.48       | V     |
| $V_{OL}$     | Output low voltage          | 1.125      | 1.02       | V     |
| $V_{OD}$     | Output differential voltage | 0.25       | 0.46       | V     |
| $V_{CM}$     | Output common mode voltage  | 1.25       | 1.25       | V     |
| $I_{DC}$     | DC output current           | 11.2       | 10.2       | mA    |

1. For input buffer, see LVDS table.

**Input Delay Block/AIL Timing**

| Parameter     | Description          | Min.  | Typ. | Max. | Units |
|---------------|----------------------|---|------|------|-------|
| $t_{FDEL}$    | Fine delay time      | 35  | 45   | 80   | ps    |
| $t_{CDEL}$    | Coarse delay time    | 1120  | 1440 | 2560 | ps    |
| $j_{t_{AIL}}$ | AIL jitter tolerance | 1 - ((N <sup>1</sup> * $t_{FDEL}$ ) / (Clock Period)) |      |      | UI    |

1. N = number of fine delays used in a particular AIL setting

**GSR Timing**

| Parameter             | Description                                     | VCC   | -7   |      | -6   |      | -5   |      | Units |
|-----------------------|---|-------|------|------|------|------|------|------|-------|
|                       |   |       | Min. | Max. | Min. | Max. | Min. | Max. |       |
| $t_{SYNC\_GSR\_MAX}$  | Maximum operating frequency for synchronous GSR | 1.14V | —    | 438  | —    | 417  | —    | 398  | MHz   |
|                       |   | 0.95V | —    | 378  | —    | 355  | —    | 337  | MHz   |
| $t_{ASYNC\_GSR\_MPW}$ | Minimum pulse width of asynchronous input       | —     | —    | —    | —    | —    | 3.3  | —    | ns    |

Note: Synchronous GSR goes out of reset in two cycles from the clock edge where the setup time of the FF was met.

**Internal System Bus Timing**

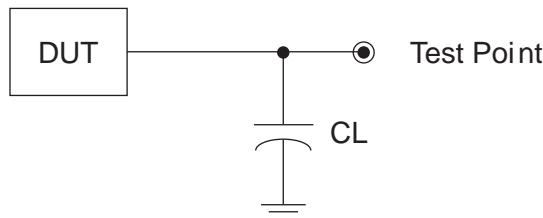

| Parameter  | Description   | -7   |      | -6   |      | -5   |      | Units |
|------------|---|------|------|------|------|------|------|-------|
|            |   | Min. | Max. | Min. | Max. | Min. | Max. |       |
| $t_{HCLK}$ | Maximum operating frequency for internal system bus HCLK. | —    | 200  | —    | 200  | —    | 200  | MHz   |

Note: There is no minimum frequency. If HCLK is sourced from the embedded oscillator, the minimum frequency limitation of the oscillator/divider is about 0.3 MHz. Refer to the oscillator data for missing configuration modes.

## Switching Test Conditions

Figure 3-15 shows the output test load that is used for AC testing. The specific values for resistance, capacitance, voltage, and other test conditions are shown in Table 3-4.

**Figure 3-15. Output Test Load, LVTTL and LVC MOS Standards**

**Table 3-4. Test Fixture Required Components, Non-Terminated Interfaces**

| Test Condition                                    | $C_L$ | Timing Ref.                | $V_T$    |
|---|-------|----------------------------|----------|
| LVTTL and other LVC MOS settings (L -> H, H -> L) | 30pF  | LVC MOS 3.3 = 1.5V         | —        |
|   |       | LVC MOS 2.5 = $V_{CCIO}/2$ | —        |
|   |       | LVC MOS 1.8 = $V_{CCIO}/2$ | —        |
|   |       | LVC MOS 1.5 = $V_{CCIO}/2$ | —        |
|   |       | LVC MOS 1.2 = $V_{CCIO}/2$ | —        |
| LVC MOS 2.5 I/O (Z -> H)                          | 30pF  | $V_{CCIO}/2$               | $V_{OL}$ |
| LVC MOS 2.5 I/O (Z -> L)                          |       | $V_{CCIO}/2$               | $V_{OH}$ |
| LVC MOS 2.5 I/O (H -> Z)                          |       | $V_{OH} - 0.15$            | $V_{OL}$ |
| LVC MOS 2.5 I/O (L -> Z)                          |       | $V_{OL} + 0.15$            | $V_{OH}$ |

Note: Output test conditions for all other interfaces are determined by the respective standards.

1. Differential pair grouping within a PIC is A (True) and B (Complement) and C (True) and D (Complement).

2. The LatticeSC/M15 in a 256-pin package does not support an MPI interface.
