### Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	20000
Number of Logic Elements/Cells	80000
Total RAM Bits	5816320
Number of I/O	660
Number of Gates	-
Voltage - Supply	0.95V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1152-BCBGA, FCBGA
Supplier Device Package	1152-CFCBGA (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga80ep1-5fc1152c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfscm3ga80ep1-5fc1152c</a>

January 2010

Data Sheet DS1004

## Features

### ■ High Performance FPGA Fabric

- 15K to 115K four input Look-up Tables (LUT4s)
- 139 to 942 I/Os
- 700MHz global clock; 1GHz edge clocks

### ■ 4 to 32 High Speed SERDES and flexiPCS™ (per Device)

- Performance ranging from 600Mbps to 3.8Gbps
- Excellent Rx jitter tolerance (0.8UI at 3.125Gbps)
- Low Tx jitter (0.25UI typical at 3.125Gbps)
- Built-in Pre-emphasis and equalization
- Low power (typically 105mW per channel)
- Embedded Physical Coding Sublayer (PCS) provides pre-engineered implementation for the following standards:
  - GbE, XAUI, PCI Express, SONET, Serial RapidIO, 1G Fibre Channel, 2G Fibre Channel

### ■ 2Gbps High Performance PURESPEED™ I/O

- Supports the following performance bandwidths
  - Differential I/O up to 2Gbps DDR (1GHz Clock)
  - Single-ended memory interfaces up to 800Mbps
- 144 Tap programmable Input Delay (INDEL) block on every I/O dynamically aligns data to clock for robust performance
  - Dynamic bit Adaptive Input Logic (AIL) monitoring and control circuitry per pin that automatically ensures proper set-up and hold
  - Dynamic bus: uses control bus from DLL
  - Static per bit
- Electrical standards supported:
  - LVCMOS 3.3/2.5/1.8/1.5/1.2, LVTTL
  - SSTL 3/2/18 I, II; HSTL 18/15 I, II
  - PCI, PCI-X
  - LVDS, Mini-LVDS, Bus-LVDS, MLVDS, LVPECL, RSRS
- Programmable On Die Termination (ODT)
  - Includes Thevenin Equivalent and low power V<sub>TT</sub> termination options

### ■ Memory Intensive FPGA

- sysMEM™ embedded Block RAM

- 1 to 7.8 Mbits memory
- True Dual Port/Pseudo Dual Port/Single Port
- Dedicated FIFO logic for all block RAM
- 500MHz performance
- Additional 240K to 1.8Mbits distributed RAM

### ■ sysCLOCK™ Network

- Eight analog PLLs per device
  - Frequency range from 15MHz to 1GHz
  - Spread spectrum support
- 12 DLLs per device with direct control of I/O delay
  - Frequency range from 100MHz to 700MHz
- Extensive clocking network
  - 700MHz primary and 325 MHz secondary clocks
  - 1GHz I/O-connected edge clocks
- Precision Clock Divider
  - Phase matched x2 and x4 division of incoming clocks
- Dynamic Clock Select (DCS)
  - Glitch free clock MUX

### ■ Masked Array for Cost Optimization (MACO™) Blocks

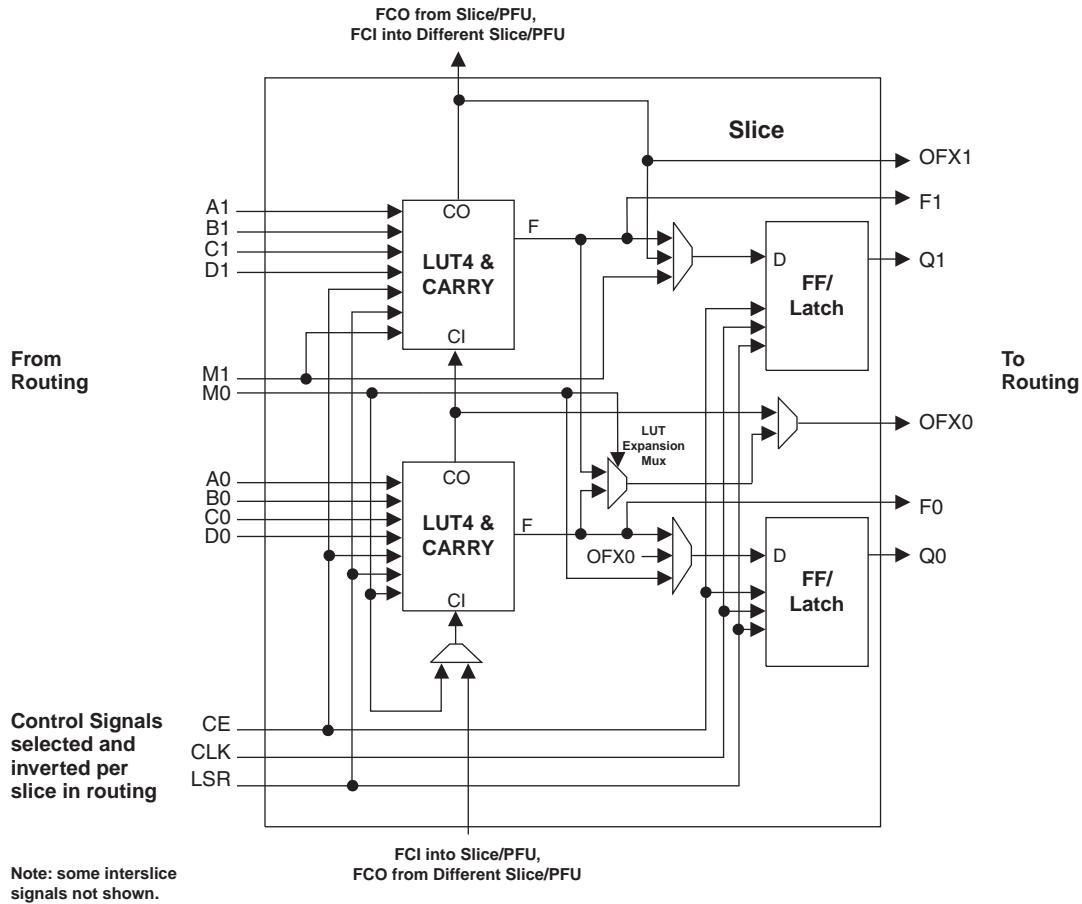

- On-chip structured ASIC Blocks provide pre-engineered IP for low power, low cost system level integration

### ■ High Performance System Bus

- Ties FPGA elements together with a standard bus framework
  - Connects to peripheral user interfaces for run-time dynamic configuration

### ■ System Level Support

- IEEE standard 1149.1 Boundary Scan, plus ispTRACY™ internal logic analyzer
- IEEE Standard 1532 in-system configuration
- 1.2V and 1.0V operation
- Onboard oscillator for initialization and general use
- Embedded PowerPC microprocessor interface
- Low cost wire-bond and high pin count flip-chip packaging
- Low cost SPI Flash RAM configuration

**Figure 2-3. Slice Diagram****Table 2-1. Slice Signal Descriptions**

Function	Type	Signal Names	Description
Input	Data signal	A0, B0, C0, D0	Inputs to LUT4
Input	Data signal	A1, B1, C1, D1	Inputs to LUT4
Input	Multi-purpose	M0	Multipurpose Input
Input	Multi-purpose	M1	Multipurpose Input
Input	Control signal	CE	Clock Enable
Input	Control signal	LSR	Local Set/Reset
Input	Control signal	CLK	System Clock
Input	Inter-PFU signal	FCI	Fast Carry In <sup>1</sup>
Output	Data signals	F0, F1	LUT4 output register bypass signals
Output	Data signals	Q0, Q1	Register Outputs
Output	Data signals	OFX0	Output of a LUT5 MUX
Output	Data signals	OFX1	Output of a LUT6, LUT7, LUT8 <sup>2</sup> MUX depending on the slice
Output	Inter-PFU signal	FCO	For the right most PFU the fast carry chain output <sup>2</sup>

1. See Figure 2-2 for connection details.

2. Requires two PFUs.

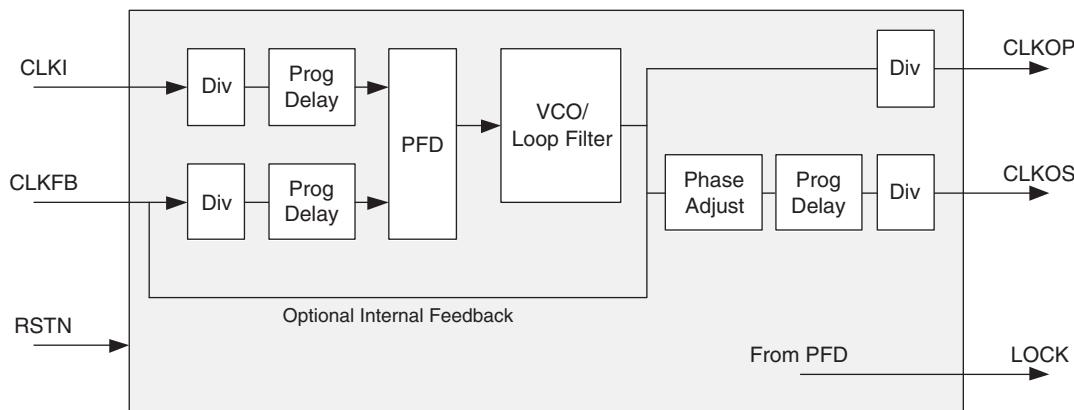

The setup and hold times of the device can be improved by programming a delay in the feedback or input path of the PLL which will advance or delay the output clock with reference to the input clock. This delay can be either programmed during configuration or can be adjusted dynamically.

The Phase Select block can modify the phase of the clock signal if desired. The Spread Spectrum block supports the modulation of the PLL output frequency. This reduces the peak energy in the fundamental and its harmonics providing for lower EMI (Electro Magnetic Interference).

The sysCLOCK PLL can be configured at power-up and then, if desired, reconfigured dynamically through the serial memory interface bus which connects with the on-chip system bus. For example, the user can select inputs, loop filters, divider setting, delay settings and phase shift settings. The user can also directly access the SMI bus through the routing.

The PLL clock input, from pin or routing, feeds into an input divider. There are four sources of feedback signal to the feedback divider: from the clock net, directly from the voltage controlled oscillator (VCO) output, from the routing or from an external pin. The signal from the input clock divider and the feedback divider are passed through the programmable delay before entering the phase frequency detector (PFD) unit. The output of this PFD is used to control the voltage controlled oscillator. There is a PLL\_LOCK signal to indicate that VCO has locked on to the input clock signal. Figure 2-11 shows the sysCLOCK PLL diagram.

**Figure 2-11. PLL Diagram**

For more information on the PLL, please see details of additional technical documentation at the end of this data sheet.

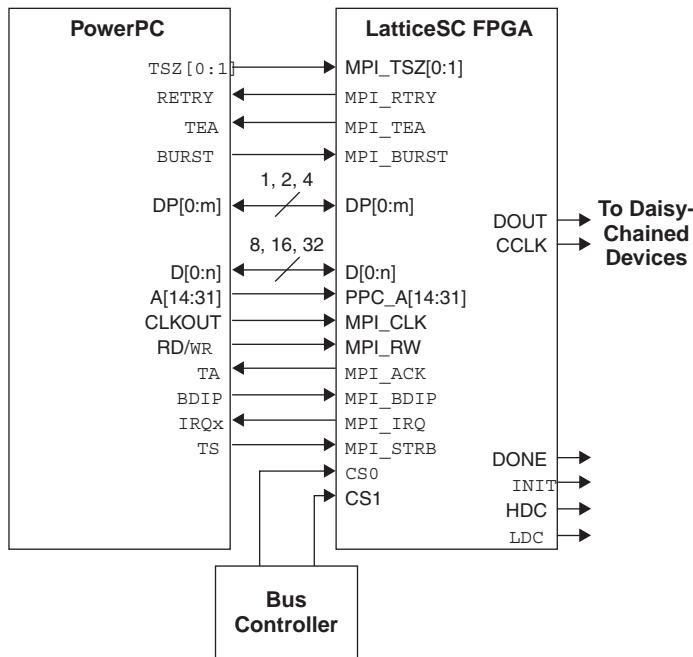

## Spread Spectrum Clocking (SSC)

The PLL supports spread spectrum clocking to reduce peak EMI by using “down-spread” modulation. The spread spectrum operation will vary the output frequency (at 30KHz to 500KHz) in a range that is between its nominal value, down to a frequency that is a programmable 1%, 2%, or 3% lower than normal.

## Digital Locked Loop (DLLs)

In addition to PLLs, the LatticeSC devices have up to 12 DLLs per device. DLLs assist in the management of clocks and strobes. DLLs are well suited to applications where the clock may be stopped or transferring jitter from input to output is important, for example forward clocked interfaces. PLLs are good for applications requiring the lowest output jitter or jitter filtering. All DLL outputs are routed as primary/edge clock sources.

The DLL has two independent clock outputs, CLKOP and CLKOS. These outputs can individually select one of the outputs from the tapped delay line. The CLKOS has optional fine phase shift and divider blocks to allow this output to be further modified, if required. The fine phase shift block allows the CLKOS output to phase shifted a further 45, 22.5 or 11.25 degrees relative to its normal position. LOCK output signal is asserted when the DLL is locked. The ALU HOLD signal setting allows users to freeze the DLL at its current delay setting.

**Figure 2-32. PowerPCI and MPI Schematic**

## Configuration and Testing

The following section describes the configuration and testing features of the LatticeSC family of devices.

### IEEE 1149.1-Compliant Boundary Scan Testability

All LatticeSC devices have boundary scan cells that are accessed through an IEEE 1149.1 compliant test access port (TAP). This allows functional testing of the circuit board, on which the device is mounted, through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port has its own supply voltage  $V_{CCJ}$  and can operate with LVCMOS33, 25 and 18 standards. For additional detail refer to technical information at the end of the data sheet.

### Device Configuration

All LatticeSC devices contain three possible ports that can be used for device configuration. The serial port, which supports bit-wide configuration, and the sysCONFIG port that supports both byte-wide and serial configuration. The MPI port supports 8-bit, 16-bit or 32-bit configuration.

The serial port supports both the IEEE Std. 1149.1 Boundary Scan specification and the IEEE Std. 1532 In-System Configuration specification. The sysCONFIG port is a 20-pin interface with six of the I/Os used as dedicated pins and the rest being dual-use pins. When sysCONFIG mode is not used, these dual-use pins are available for general purpose I/O. All I/Os for the sysCONFIG and MPI ports are in I/O bank #1.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port. Once a configuration port is selected, that port is locked and another configuration port cannot be activated until the next re-initialization sequence. For additional detail refer to technical information at the end of the data sheet.

**LatticeSC/M External Switching Characteristics<sup>3</sup>**

Over Recommended Commercial Operating Conditions at VCC = 1.2V +/- 5%

Parameter	Description	-7		-6		-5		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
<b>General I/O Pin Parameters (using Primary Clock without PLL)<sup>2</sup></b>

1. No PLL delay tuning (clock injection removal mode, system clock feedback).

2. Using LVCMS25 12mA I/O. Timing adders for other supported I/O technologies are specified in the LatticeSC Family Timing Adders table.

3. Complete Timing Parameters for a user design are incorporated when running ispLEVER. This is a sampling of the key timing parameters.  
Timing specs are for non-AI applications.
