Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Initialization and Standby Supply Current

The table below indicates initialization and standby supply current while operating at 85°C junction temperature (T_J), which is the high end of the commercial temperature range, and 105°C, which is the high end of the industrial temperature range. This data assumes all outputs are tri-stated and all inputs are configured as LVCMOS and held at V_{CCIO} or GND. The remaining SERDES supply current for V_{DDIB} and V_{DDOB} is detailed in the SERDES section of this data sheet. For power at your design temperature, it is recommended to use the Power Calculator tool which is accessible in ispLEVER or can be used as a standalone tool. For more information on supply current, see the reference to additional technical documentation available at the end of this data sheet.

1. Input only.

2. Inputs on chip. Outputs are implemented with the addition of external resistors.

3. Input for this standard does not depend on the value of V_{CCIO}.

4. Inputs for this standard cannot be in 3.3V VCCIO banks (≤ 2.5V only).

Switching Characteristics

All devices are 100% functionally tested. Listed below are representative values of internal and external timing parameters. For more specific, more precise, and worst-case guaranteed data at a particular temperature and voltage, use the values reported by the static timing analyzer in the ispLEVER design tool from Lattice and back-annotate to the simulation net list.
