
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	4MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	22
Program Memory Size	7KB (4K x 14)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	192 x 8
Voltage - Supply (Vcc/Vdd)	4V ~ 5.5V
Data Converters	A/D 5x8b
Oscillator Type	External
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16c73b-04e-so

TIMER1 MODULE

Timer1 Module Data Sheet Errata

Clarifications/Corrections to the Data Sheet:

In the Device data sheets listed below, the following clarifications and corrections should be noted. Any silicon issues related to the Timer1 Module will be reported in a separate silicon errata. Please check the Microchip web site for any existing issues.

1. Asynchronous Counter

When Timer1 is started or updated, the timer needs to see a falling edge from the external clock source before a rising edge can increment the counter. If writes to TMR1H and TMR1L are not completed while the external clock pulse is still high, Timer1 will miss counting the first clock pulse after the update.

When using an external crystal, the pulse width from rising to falling edge is temperature dependent and may decrease with temperature. As a result, the timer may require an additional oscillation to overflow.

Code examples are given for the affected devices:

- PIC12/14/16/17 devices – Example 1 and Example 2
- PIC18 devices – Example 3

Both examples include code to wait for Timer1 to increment twice between the `RTCisr` and `Update` labels.

In PIC18 devices, it is not possible to reliably update Timer1 in a *low-priority* interrupt. A high-priority interrupt could occur at any time and unexpectedly delay the TMR1 update.

PIC18 devices also include Timer3 which is functionally identical to Timer1.

Work around

Switching Timer1 to the main system oscillator after reloading, the timer ensures the timer will see a falling edge before switching back to the external clock source.

Due to the time from Timer1 overflow to the reload being application specific, wait for the timer to increment before beginning the reload sequence. This ensures the timer does not miss a rising edge during reload. The timing of the clock source changing is critical and is detailed in Example 1 and Example 2.

EXAMPLE 1: PIC12/14/16/17 CODE EXAMPLE FOR 1 SECOND OVERFLOW PERIOD WITH 32.786 kHZ OSCILLATOR

```
    BTFSC    TMR1L,0
    GOTO     $-1
    BTFSS    TMR1L,0
    GOTO     $-1             ;Timer has just incremented, 31 µs before next rising edge to
                             ;complete reload
Update:

    BCF      T1CON,TMR1CS    ;Select system clock for Timer1
    BSF      TMR1H,7         ;Timer1 high byte 0x80
    BCF      T1CON,TMR1ON    ;Timer1 off
    BSF      T1CON,TMR1C     ;Select external crystal
    BSF      T1CON,TMR1ON    ;Timer1 on

Critical Timing of code sequence for instructions following last write to TMR1L or TMR1H.
```

EXAMPLE 2: PIC12/14/16/17 CODE EXAMPLE FOR OVERFLOW PERIODS OTHER THAN 1 SECOND OR USING AN OSCILLATOR OTHER THAN 32.768 kHZ

```
    BTFSC    TMR1L, 0
    GOTO     $-1
    BTFSS    TMR1L, 0
    GOTO     $-1                ;Timer has just incremented, 31µs before next rising
                                ;edge to complete reload.

    BCF      T1CON, TMR1CS      ;Select system clock for Timer1.
    MOVF     TMR1, W            ;Sample low byte of Timer1 before increments.
    ADDWF    TMR1_Reload_lo, F  ;Add reload value for low byte
    BTFSC    STATUS, C          ;if this generates a carry then
    INCF     TMR1_Reload_hi, F  ;modify the reload value for the high byte.

    MOVF     TMR1_Reload_hi, W  ;Reload Timer1 high byte.
    MOVWF    TMR1H

    MOVF     TMR1_Reload_lo, W  ;Reload Timer1 low byte.
    MOVW     TMR1L

    BCF      T1CON, TMR1ON      ;Timer1 off.
    BSF      T1CON, TMR1CS      ;Select external crystal.
    BSF      T1CON, TMR1ON      ;Timer1 on.

    Critical Timing of code sequence for instructions.
```

EXAMPLE 3: PIC18 HIGH-PRIORITY INTERRUPT SERVICE ROUTINE

```
HIntVector  code 0x0008    ;   (3-4Tcy), fixed interrupt latency
    goto    HighISR        ;   (3Tcy) jump to high priority ISR code

            code           ;   unprotected code space
HighISR:
    btfss   PIR1,TMR1IF    ;   (1Tcy) TMR1 overflow?
    goto    NextISR        ;   (2Tcy) No, check another interrupt source

;   Insert the next 4 lines of code when TMR1 can not
;   be reliably updated before clock pulse goes low
RTCisr:
    btfsc   TMR1L,0        ;   wait for TMR1L<0> to become clear
    bra     $-2            ;   may already be clear (loops for 0 to 30.5us)
    btfss   TMR1L,0        ;   wait for TMR1L<0> to become set
    bra     $-2            ;   (loops for 30.5us)

; If TMR1 update can be completed before clock pulse
; goes low, start update here
Update:
    bsf     TMR1H,7        ;   reload for next 1 second overflow
    bcf     PIR1,TMR1IF    ;   clear flag
    incf    Seconds,F      ;   record second
    retfie  FAST

NextISR:                   ;   Another interrupt source...
    ....                   ;   code for other interrupts, if needed

retfieFAST
```

REVISION HISTORY

Rev A Document (7/2007)
Initial release of this errata.

Rev B Document (03/2010)

Added PIC12F617 device to the Clarifications/ Corrections to the Data Sheet section.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
