

Welcome to **E-XFL.COM**

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

Details	
Product Status	Active
Core Processor	AVR
Core Size	8-Bit
Speed	20MHz
Connectivity	I ² C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	18
Program Memory Size	4KB (2K x 16)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	20-WFQFN Exposed Pad
Supplier Device Package	20-QFN-EP (4x4)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/attiny4313-mu

1. Pin Configurations

Figure 1-1. Pinout ATtiny2313A/4313

PDIP/SOIC

MLF/VQFN

NOTE: Bottom pad should be soldered to ground.

1.1 Pin Descriptions

1.1.1 VCC

Digital supply voltage.

1.1.2 GND

Ground.

1.1.3 Port A (PA2..PA0)

Port A is a 3-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability, except PA2 which has the RESET capability. To use pin PA2 as I/O pin, instead of RESET pin, program ("0") RSTDISBL fuse. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATtiny2313A/4313 as listed on page 61.

1.1.4 Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATtiny2313A/4313 as listed on page 62.

1.1.5 Port D (PD6..PD0)

Port D is a 7-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATtiny2313A/4313 as listed on page 66.

1.1.6 **RESET**

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running and provided that the reset pin has not been disabled. The minimum pulse length is given in Table 22-3 on page 201. Shorter pulses are not guaranteed to generate a reset. The Reset Input is an alternate function for PA2 and dW.

The reset pin can also be used as a (weak) I/O pin.

1.1.7 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit. XTAL1 is an alternate function for PA0.

1.1.8 XTAL2

Output from the inverting Oscillator amplifier. XTAL2 is an alternate function for PA1.

2. Overview

The ATtiny2313A/4313 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATtiny2313A/4313 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

2.1 Block Diagram

Figure 2-1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATtiny2313A/4313 provides the following features: 2/4K bytes of In-System Programmable Flash, 128/256 bytes EEPROM, 128/256 bytes SRAM, 18 general purpose I/O lines, 32 general purpose working registers, a single-wire Interface for On-chip Debugging, two flexible Timer/Counters with compare modes, internal and external interrupts, a serial programmable USART, Universal Serial Interface with Start Condition Detector, a programmable Watchdog Timer with internal Oscillator, and three software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or hardware reset. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low-power consumption.

The device is manufactured using Atmel's high density non-volatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, or by a conventional non-volatile memory programmer. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATtiny2313A/4313 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATtiny2313A/4313 AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators, In-Circuit Emulators, and Evaluation kits.

2.2 Comparison Between ATtiny2313A and ATtiny4313

The ATtiny2313A and ATtiny4313 differ only in memory sizes. Table 2-1 summarizes the different memory sizes for the two devices.

Table 2-1.Memory Size Summary

Device	Flash	EEPROM	RAM
ATtiny2313A	2K Bytes	128 Bytes	128 Bytes
ATtiny4313	4K Bytes	256 Bytes	256 Bytes

3. About

3.1 Resources

A comprehensive set of drivers, application notes, data sheets and descriptions on development tools are available for download at http://www.atmel.com/avr.

3.2 Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. These code examples assume that the part specific header file is included before compilation. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

For I/O Registers located in the extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically, this means "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR". Note that not all AVR devices include an extended I/O map.

3.3 Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

4. Register Summary

ATtiny2313A/4313

Notes:

- 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
- 2. I/O Registers within the address range 0x00 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the status flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operate on the specified bit, and can therefore be used on registers containing such status flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses 0x00 0x3F must be used. When addressing I/O Registers as data space using LD and ST instructions, 0x20 must be added to these addresses.

5. Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AND L	OGIC INSTRUCTIONS	8			
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	Rdh:Rdl ← Rdh:Rdl + K	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	$Rd \leftarrow Rd - Rr$	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	$Rd \leftarrow Rd - K$	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	$Rd \leftarrow Rd - Rr - C$	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	$Rd \leftarrow Rd - K - C$	Z,C,N,V,H	1
SBIW	Rdl,K	Subtract Immediate from Word	Rdh:Rdl ← Rdh:Rdl - K	Z,C,N,V,S	2
AND	Rd, Rr	Logical AND Registers	$Rd \leftarrow Rd \bullet Rr$	Z,N,V	1
ANDI	Rd, K	Logical AND Register and Constant	$Rd \leftarrow Rd \bullet K$	Z,N,V	1
OR	Rd, Rr	Logical OR Registers	$Rd \leftarrow Rd v Rr$	Z,N,V	1
ORI	Rd, K	Logical OR Register and Constant	$Rd \leftarrow Rd \vee K$	Z,N,V	1
EOR	Rd, Rr	Exclusive OR Registers	$Rd \leftarrow Rd \oplus Rr$	Z,N,V	1
COM	Rd	One's Complement	$Rd \leftarrow 0xFF - Rd$	Z,C,N,V	1
NEG	Rd	Two's Complement	$Rd \leftarrow 0x00 - Rd$	Z,C,N,V,H	1
SBR	Rd,K	Set Bit(s) in Register	$Rd \leftarrow Rd \vee K$	Z,N,V	1
CBR	Rd,K	Clear Bit(s) in Register	$Rd \leftarrow Rd \bullet (0xFF - K)$	Z,N,V	1
INC	Rd	Increment	Rd ← Rd + 1	Z,N,V	1
DEC	Rd	Decrement	Rd ← Rd – 1	Z,N,V	1
TST	Rd	Test for Zero or Minus	$Rd \leftarrow Rd \bullet Rd$	Z,N,V	1

			ZUIVIZ (5)(6)	ATtiny2313A-MMHR

Notes:

- 1. For speed vs. supply voltage, see section 22.3 "Speed" on page 199.
- 2. All packages are Pb-free, halide-free and fully green, and they comply with the European directive for Restriction of Hazard-ous Substances (RoHS).
- 3. Code indicators:
- H: NiPdAu lead finish
- U or N: matte tin
- R: tape & reel
- 4. Can also be supplied in wafer form. Contact your local Atmel sales office for ordering information and minimum quantities.
- 5. NiPdAu finish
- 6. Topside markings:
- 1st Line: T23132nd Line: Axx
- 3rd Line: xxx

Package Type					
20-lead, 0.300" Wide, Plastic Dual Inline Package (PDIP)

8. Errata

The revision letters in this section refer to the revision of the corresponding ATtiny2313A/4313 device.

8.1 ATtiny2313A

8.1.1 Rev. D

No known errata.

8.1.2 Rev. A – C

These device revisions were referred to as ATtiny2313/ATtiny2313V.

8.2 ATtiny4313

8.2.1 Rev. A

No known errata.

9. Datasheet Revision History

9.1 Rev. 8246B - 10/11

- 1. Updated device status from Preliminary to Final.
- 2. Updated document template.
- 3. Added order codes for tape&reel devices, on page 259 and page 260
- 4. Updated figures:
 - Figure 23-33 on page 223
 - Figure 23-44 on page 228
 - Figure 23-81 on page 247
 - Figure 23-92 on page 252
- 5. Updated sections:
 - Section 5. "Memories" on page 15
 - Section 19. "Self-Programming" on page 172
 - Section 20. "Lock Bits, Fuse Bits and Device Signature" on page 177
 - Section 21. "External Programming" on page 183
 - Section 26. "Ordering Information" on page 259

9.2 Rev. 8246A - 11/09

- 1. Initial revision. Created from document 2543 t2313.
- 2. Updated datasheet template.
- 3. Added VQFN in the Pinout Figure 1-1 on page 2.
- 4. Added Section 7.2 "Software BOD Disable" on page 34.
- Added Section 7.3 "Power Reduction Register" on page 34.
- 6. Updated Table 7-2, "Sleep Mode Select," on page 36.
- 7. Added Section 7.5.3 "BODCR Brown-Out Detector Control Register" on page 37.
- 8. Added reset disable function in Figure 8-1 on page 38.
- 9. Added pin change interrupts PCINT1 and PCINT2 in Table 9-1 on page 47.
- 10. Added PCINT17..8 and PCMSK2..1 in Section 9.2 "External Interrupts" on page 48.
- 11. Added Section 9.3.4 "PCMSK2 Pin Change Mask Register 2" on page 52.
- 12. Added Section 9.3.5 "PCMSK1 Pin Change Mask Register 1" on page 52.
- 13. Updated Section 10.2.1 "Alternate Functions of Port A" on page 61.
- 14. Updated Section 10.2.2 "Alternate Functions of Port B" on page 62.
- 15. Updated Section 10.2.3 "Alternate Functions of Port D" on page 66.
- Added UMSEL1 and UMSEL0 in Section 14.10.4 "UCSRC USART Control and Status Register C" on page 139.
- 17. Added Section 15. "USART in SPI Mode" on page 145.
- 18. Added USI Buffer Register (USIBR) in Section 16.2 "Overview" on page 155 and in Figure 16-1 on page 155.
- 19. Added Section 16.5.4 "USIBR USI Buffer Register" on page 166.
- 20. Updated Section 19.6.3 "Reading Device Signature Imprint Table from Firmware" on page 175.
