

Welcome to <u>E-XFL.COM</u>

Understanding <u>Embedded - FPGAs (Field</u> <u>Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

E·XFI

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	110592
Number of I/O	235
Number of Gates	600000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)

Flash*Freeze Technology and Low Power Modes

power supply and board-level configurations, the user can easily calculate how long it will take for the core to become inactive or active. For more information, refer to the "Power-Up/-Down Behavior of Low Power Flash Devices" section on page 373.

Figure 2-8 • Entering and Exiting Sleep Mode, Typical Timing Diagram

Context Save and Restore in Sleep or Shutdown Mode

In Sleep mode or Shutdown mode, the contents of the SRAM, state of the I/Os, and state of the registers are lost when the device is powered off, if no other measure is taken. A low-cost external serial EEPROM can be used to save and restore the contents of the device when entering and exiting Sleep mode or Shutdown mode. In the *Embedded SRAM Initialization Using External Serial EEPROM* application note, detailed information and a reference design are provided for initializing the embedded SRAM using an external serial EEPROM. The user can easily customize the reference design to save and restore the FPGA state when entering and exiting Sleep mode or Shutdown mode. The microcontroller will need to manage this activity; hence, before powering down V_{CC} , the data will be read from the FPGA and stored externally. In a similar way, after the FPGA is powered up, the microcontroller will allow the FPGA to load the data from external memory and restore its original state.

Flash*Freeze Design Guide

This section describes how designers can create reliable designs that use ultra-low power Flash*Freeze modes optimally. The section below provides guidance on how to select the best Flash*Freeze mode for any application. The "Design Solutions" section on page 35 gives specific recommendations on how to design and configure clocks, set/reset signals, and I/Os. This section also gives an overview of the design flow and provides details concerning Microsemi's Flash*Freeze Management IP, which enables clean clock gating and housekeeping. The "Additional Power Conservation Techniques" section on page 41 describes board-level considerations for entering and exiting Flash*Freeze mode.

Selecting the Right Flash*Freeze Mode

Both Flash*Freeze modes will bring an FPGA into an ultra-low power static mode that retains register and SRAM content and sets I/Os to a predetermined configuration. There are two primary differences that distinguish type 2 mode from type 1, and they must be considered when creating a design using Flash*Freeze technology.

First, with type 2 mode, the device has an opportunity to wait for a second signal to enable activation of Flash*Freeze mode. This allows processes to complete prior to deactivating the device, and can be useful to control task completion, data preservation, accidental Flash*Freeze activation, system shutdown, or any other housekeeping function. The second signal may be derived from an external or into-out internal source. The second difference between type 1 and type 2 modes is that a design for type 2 mode has an opportunity to cleanly manage clocks and data activity before entering and exiting Flash*Freeze mode. This is particularly important when data preservation is needed, as it ensures valid data is stored prior to entering, and upon exiting, Flash*Freeze mode.

Type 1 Flash*Freeze mode is ideally suited for applications with the following design criteria:

- Entering Flash*Freeze mode is not dependent on any signal other than the external FF pin.
- Internal housekeeping is not required prior to entering Flash*Freeze.

Flash*Freeze Technology and Low Power Modes

Figure 2-11 • FSM State Diagram

Phase Adjustment

The four phases available (0, 90, 180, 270) are phases with respect to VCO (PLL output). The VCO is divided to achieve the user's CCC required output frequency (GLA, YB/GLB, YC/GLC). The division happens after the selection of the VCO phase. The effective phase shift is actually the VCO phase shift divided by the output divider. This is why the visual CCC shows both the actual achievable phase and more importantly the actual delay that is equivalent to the phase shift that can be achieved.

Dynamic PLL Configuration

The CCCs can be configured both statically and dynamically.

In addition to the ports available in the Static CCC, the Dynamic CCC has the dynamic shift register signals that enable dynamic reconfiguration of the CCC. With the Dynamic CCC, the ports CLKB and CLKC are also exposed. All three clocks (CLKA, CLKB, and CLKC) can be configured independently.

The CCC block is fully configurable. The following two sources can act as the CCC configuration bits.

Flash Configuration Bits

The flash configuration bits are the configuration bits associated with programmed flash switches. These bits are used when the CCC is in static configuration mode. Once the device is programmed, these bits cannot be modified. They provide the default operating state of the CCC.

Dynamic Shift Register Outputs

This source does not require core reprogramming and allows core-driven dynamic CCC reconfiguration. When the dynamic register drives the configuration bits, the user-defined core circuit takes full control over SDIN, SDOUT, SCLK, SSHIFT, and SUPDATE. The configuration bits can consequently be dynamically changed through shift and update operations in the serial register interface. Access to the logic core is accomplished via the dynamic bits in the specific tiles assigned to the PLLs.

Figure 4-21 illustrates a simplified block diagram of the MUX architecture in the CCCs.

Note: *For Fusion, bit <88:81> is also needed.

The selection between the flash configuration bits and the bits from the configuration register is made using the MODE signal shown in Figure 4-21. If the MODE signal is logic HIGH, the dynamic shift register configuration bits are selected. There are 81 control bits to configure the different functions of the CCC.

Figure 4-21 • The CCC Configuration MUX Architecture

Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs

Config. Bits	Signal	Name	Description
<31:29>	OAMUX[2:0]	GLA Output Select	Selects from the VCO's four phase outputs for GLA.
<28:24>	OCDIV[4:0]	Secondary 2 Output Divider	Sets the divider value for the GLC/YC outputs. Also known as divider w in Figure 4-20 on page 101. The divider value will be OCDIV[4:0] + 1.
<23:19>	OBDIV[4:0]	Secondary 1 Output Divider	Sets the divider value for the GLB/YB outputs. Also known as divider v in Figure 4-20 on page 101. The divider value will be OBDIV[4:0] + 1.
<18:14>	OADIV[4:0]	Primary Output Divider	Sets the divider value for the GLA output. Also known as divider <i>u</i> in Figure 4-20 on page 101. The divider value will be OADIV[4:0] + 1.
<13:7>	FBDIV[6:0]	Feedback Divider	Sets the divider value for the PLL core feedback. Also known as divider <i>m</i> in Figure 4-20 on page 101. The divider value will be FBDIV[6:0] + 1.
<6:0>	FINDIV[6:0]	Input Divider	Input Clock Divider (/n). Sets the divider value for the input delay on CLKA. The divider value will be FINDIV[6:0] + 1.

Table 4-8 • Configuration Bit Descriptions for the CCC Blocks (continued)

Notes:

1. The <88:81> configuration bits are only for the Fusion dynamic CCC.

 This value depends on the input clock source, so Layout must complete before these bits can be set. After completing Layout in Designer, generate the "CCC_Configuration" report by choosing Tools > Report > CCC_Configuration. The report contains the appropriate settings for these bits. Table 4-9 to Table 4-15 on page 110 provide descriptions of the configuration data for the configuration bits.

endmodule

Delayed Clock Configuration

The CLKDLY macro can be generated with the desired delay and input clock source (Hardwired I/O, External I/O, or Core Logic), as in Figure 4-28.

Figure 4-28 • Delayed Clock Configuration Dialog Box

After setting all the required parameters, users can generate one or more PLL configurations with HDL or EDIF descriptions by clicking the **Generate** button. SmartGen gives the option of saving session results and messages in a log file:

```
Macro Parameters
*****
                               : delay_macro
Name
Family
                               : ProASIC3
                               : Verilog
Output Format
                               : Delayed Clock
Type
Delay Index
                               : 2

                               : Hardwired I/O
Total Clock Delay = 0.935 ns.
The resultant CLKDLY macro Verilog netlist is as follows:
module delay_macro(GL,CLK);
output GL;
input CLK;
```

Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs

Date	Changes	Page
v1.4 (December 2008)	The"CCC Support in Microsemi's Flash Devices" section was updated to include IGLOO nano and ProASIC3 nano devices.	79
	Figure 4-2 • CCC Options: Global Buffers with No Programmable Delay was revised to add the CLKBIBUF macro.	80
	The description of the reference clock was revised in Table 4-2 • Input and Output Description of the CLKDLY Macro.	81
	Figure 4-7 • Clock Input Sources (30 k gates devices and below) is new. Figure 4-8 • Clock Input Sources Including CLKBUF, CLKBUF_LVDS/LVPECL, and CLKINT (60 k gates devices and above) applies to 60 k gate devices and above.	88
	The "IGLOO and ProASIC3" section was updated to include information for IGLOO nano devices.	89
	A note regarding Fusion CCCs was added to Figure 4-9 • Illustration of Hardwired I/O (global input pins) Usage for IGLOO and ProASIC3 devices 60 k Gates and Larger and the name of the figure was changed from Figure 4-8 • Illustration of Hardwired I/O (global input pins) Usage. Figure 4-10 • Illustration of Hardwired I/O (global input pins) Usage for IGLOO and ProASIC3 devices 30 k Gates and Smaller is new.	90
	Table 4-5 • Number of CCCs by Device Size and Package was updated to include IGLOO nano and ProASIC3 nano devices. Entries were added to note differences for the CS81, CS121, and CS201 packages.	94
	The "Clock Conditioning Circuits without Integrated PLLs" section was rewritten.	95
	The "IGLOO and ProASIC3 CCC Locations" section was updated for nano devices.	97
	Figure 4-13 • CCC Locations in the 15 k and 30 k Gate Devices was deleted.	4-20
v1.3 (October 2008)	This document was updated to include Fusion and RT ProASIC3 device information. Please review the document very carefully.	N/A
	The "CCC Support in Microsemi's Flash Devices" section was updated.	79
	In the "Global Buffer with Programmable Delay" section, the following sentence was changed from: "In this case, the I/O must be placed in one of the dedicated global I/O locations." To	80
	"In this case, the software will automatically place the dedicated global I/O in the appropriate locations."	
	Figure 4-4 • CCC Options: Global Buffers with PLL was updated to include OADIVRST and OADIVHALF.	83
	In Figure 4-6 • CCC with PLL Block "fixed delay" was changed to "programmable delay".	83
	Table 4-3 • Input and Output Signals of the PLL Block was updated to include OADIVRST and OADIVHALF descriptions.	84
	Table 4-8 • Configuration Bit Descriptions for the CCC Blocks was updated to include configuration bits 88 to 81. Note 2 is new. In addition, the description for bit <76:74> was updated.	106
	Table 4-16 • Fusion Dynamic CCC Clock Source Selection and Table 4-17 • Fusion Dynamic CCC NGMUX Configuration are new.	110
	Table 4-18 • Fusion Dynamic CCC Division by Half Configuration and Table 4-19 • Configuration Bit <76:75> / VCOSEL<2:1> Selection for All Families are new.	111

Note: When using the SRAM in single-port mode for Automotive ProASIC3 devices, ADDRB should be tied to ground.

	ADDRx	
D×W	Unused	Used
4k×1	None	[11:0]
2k×2	[11]	[10:0]
1k×4	[11:10]	[9:0]
512×9	[11:9]	[8:0]

Table 0-3 • Audiess Fills Ullused/Used for validus Subbolied Dus Widils

Note: The "x" in ADDRx implies A or B.

DINA and DINB

These are the input data signals, and they are nine bits wide. Not all nine bits are valid in all configurations. When a data width less than nine is specified, unused high-order signals must be grounded (Table 6-4).

Note: When using the SRAM in single-port mode for Automotive ProASIC3 devices, DINB should be tied to ground.

DOUTA and DOUTB

These are the nine-bit output data signals. Not all nine bits are valid in all configurations. As with DINA and DINB, high-order bits may not be used (Table 6-4). The output data on unused pins is undefined.

|--|

	DINx/DOUTx	
D×W	Unused	Used
4k×1	[8:1]	[0]
2k×2	[8:2]	[1:0]
1k×4	[8:4]	[3:0]
512×9	None	[8:0]

Note: The "x" in DINx or DOUTx implies A or B.

RAM512X18 Macro

RAM512X18 is the two-port configuration of the same RAM block (Figure 6-5 on page 156). Like the RAM4K9 nomenclature, the RAM512X18 nomenclature refers to both the deepest possible configuration and the widest possible configuration the two-port RAM block can assume. In two-port mode, the RAM block can be configured to either the 512×9 aspect ratio or the 256×18 aspect ratio. RAM512X18 is also fully synchronous and has the following features:

- Dedicated read and write ports
- · Active-low read and write enables
- · Selectable pipelined or nonpipelined read
- Active-low asynchronous reset
- Designer software will automatically facilitate falling-edge clocks by bubble-pushing the inversion to previous stages.

256×18 FIFO is full, even though a 128×18 FIFO was requested. For this example, the Almost-Full flag can be used instead of the Full flag to signal when the 128th data word is reached.

To accommodate different aspect ratios, the almost-full and almost-empty values are expressed in terms of data bits instead of data words. SmartGen translates the user's input, expressed in data words, into data bits internally. SmartGen allows the user to select the thresholds for the Almost-Empty and Almost-Full flags in terms of either the read data words or the write data words, and makes the appropriate conversions for each flag.

After the empty or full states are reached, the FIFO can be configured so the FIFO counters either stop or continue counting. For timing numbers, refer to the appropriate family datasheet.

Signal Descriptions for FIFO4K18

The following signals are used to configure the FIFO4K18 memory element:

WW and RW

These signals enable the FIFO to be configured in one of the five allowable aspect ratios (Table 6-6).

WW[2:0]	RW[2:0]	D×W
000	000	4k×1
001	001	2k×2
010	010	1k×4
011	011	512×9
100	100	256×18
101, 110, 111	101, 110, 111	Reserved

Table 6-6 • Aspect Ratio Settings for WW[2:0]

WBLK and RBLK

These signals are active-low and will enable the respective ports when LOW. When the RBLK signal is HIGH, that port's outputs hold the previous value.

WEN and REN

Read and write enables. WEN is active-low and REN is active-high by default. These signals can be configured as active-high or -low.

WCLK and RCLK

These are the clock signals for the synchronous read and write operations. These can be driven independently or with the same driver.

Note: For the Automotive ProASIC3 FIFO4K18, for the same clock, 180° out of phase (inverted) between clock pins should be used.

RPIPE

This signal is used to specify pipelined read on the output. A LOW on RPIPE indicates a nonpipelined read, and the data appears on the output in the same clock cycle. A HIGH indicates a pipelined read, and data appears on the output in the next clock cycle.

RESET

This active-low signal resets the control logic and forces the output hold state registers to zero when asserted. It does not reset the contents of the memory array (Table 6-7 on page 160).

While the RESET signal is active, read and write operations are disabled. As with any asynchronous RESET signal, care must be taken not to assert it too close to the edges of active read and write clocks.

WD

This is the input data bus and is 18 bits wide. Not all 18 bits are valid in all configurations. When a data width less than 18 is specified, unused higher-order signals must be grounded (Table 6-7 on page 160).

SmartGen enables the user to configure the desired RAM element to use either a single clock for read and write, or two independent clocks for read and write. The user can select the type of RAM as well as the width/depth and several other parameters (Figure 6-13).

Figure 6-13 • SmartGen Memory Configuration Interface

SmartGen also has a Port Mapping option that allows the user to specify the names of the ports generated in the memory block (Figure 6-14).

Figure 6-14 • Port Mapping Interface for SmartGen-Generated Memory

SmartGen also configures the FIFO according to user specifications. Users can select no flags, static flags, or dynamic flags. Static flag settings are configured using configuration flash and cannot be altered

7 – I/O Structures in IGLOO and ProASIC3 Devices

Introduction

Low power flash devices feature a flexible I/O structure, supporting a range of mixed voltages (1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V) through bank-selectable voltages. IGLOO,[®] ProASIC3[®]L, and ProASIC3 families support Standard, Standard Plus, and Advanced I/Os.

Users designing I/O solutions are faced with a number of implementation decisions and configuration choices that can directly impact the efficiency and effectiveness of their final design. The flexible I/O structure, supporting a wide variety of voltages and I/O standards, enables users to meet the growing challenges of their many diverse applications. Libero SoC software provides an easy way to implement I/Os that will result in robust I/O design.

This document first describes the two different I/O types in terms of the standards and features they support. It then explains the individual features and how to implement them in Libero SoC.

Figure 7-1 • DDR Configured I/O Block Logical Representation

Temporary overshoots are allowed according to the overshoot and undershoot table in the datasheet.

Figure 7-9 • Solution 1

Solution 2

The board-level design must ensure that the reflected waveform at the pad does not exceed the voltage overshoot/undershoot limits provided in the datasheet. This is a requirement to ensure long-term reliability.

This scheme will also work for a 3.3 V PCI/PCI-X configuration, but the internal diode should not be used for clamping, and the voltage must be limited by the external resistors and Zener, as shown in Figure 7-10. Relying on the diode clamping would create an excessive pad DC voltage of 3.3 V + 0.7 V = 4 V.

Table 8-11 • Hot-Swap Level 3

Description	Hot-swap while bus idle
Power Applied to Device	Yes
Bus State	Held idle (no ongoing I/O processes during insertion/removal)
Card Ground Connection	Reset must be maintained for 1 ms before, during, and after insertion/removal.
Device Circuitry Connected to Bus Pins	Must remain glitch-free during power-up or power- down
Example Application	Board bus shared with card bus is "frozen," and there is no toggling activity on the bus. It is critical that the logic states set on the bus signal not be disturbed during card insertion/removal.
Compliance of IGLOO and ProASIC3 Devices	30 k gate devices, all IGLOOe/ProASIC3E devices: Compliant with two levels of staging (first: GND; second: all other pins)
	Other IGLOO/ProASIC3 devices: Compliant:
	Option A – Two levels of staging (first: GND; second: all other pins) together with bus switch on the I/Os
	Option B – Three levels of staging (first: GND; second: supplies; third: all other pins)

Table 8-12 • Hot-Swap Level 4

Description	Hot-swap on an active bus
Power Applied to Device	Yes
Bus State	Bus may have active I/O processes ongoing, but device being inserted or removed must be idle.
Card Ground Connection	Reset must be maintained for 1 ms before, during, and after insertion/removal.
Device Circuitry Connected to Bus Pins	Must remain glitch-free during power-up or power- down
Example Application	There is activity on the system bus, and it is critical that the logic states set on the bus signal not be disturbed during card insertion/removal.
Compliance of IGLOO and ProASIC3 Devices	30 k gate devices, all IGLOOe/ProASIC3E devices: Compliant with two levels of staging (first: GND; second: all other pins)
	Other IGLOO/ProASIC3 devices: Compliant:
	Option A – Two levels of staging (first: GND; second: all other pins) together with bus switch on the I/Os
	Option B – Three levels of staging (first: GND; second: supplies; third: all other pins)

I/O Cell Architecture

Low power flash devices support DDR in the I/O cells in four different modes: Input, Output, Tristate, and Bidirectional pins. For each mode, different I/O standards are supported, with most I/O standards having special sub-options. For the ProASIC3 nano and IGLOO nano devices, DDR is supported only in the 60 k, 125 k, and 250 k logic densities. Refer to Table 10-2 for a sample of the available I/O options. Additional I/O options can be found in the relevant family datasheet.

DDR Register Type	I/О Туре	I/O Standard	Sub-Options	Comments			
Receive Register	Input	Normal	None	3.3 V TTL (default)			
		LVCMOS	Voltage	1.5 V, 1.8 V, 2.5 V, 5 V (1.5 V default)			
			Pull-Up	None (default)			
		PCI/PCI-X	None				
		GTL/GTL+	Voltage	2.5 V, 3.3 V (3.3 V default)			
		HSTL	Class	I / II (I default)			
		SSTL2/SSTL3	Class	I / II (I default)			
		LVPECL	None				
		LVDS	None				
Transmit Register	Output	Normal	None	3.3 V TTL (default)			
		LVTTL	Output Drive	2, 4, 6, 8, 12, 16, 24, 36 mA (8 mA default)			
			Slew Rate	Low/high (high default)			
		LVCMOS	Voltage	1.5 V, 1.8 V, 2.5 V, 5 V (1.5 V default)			
		PCI/PCI-X	None				
		GTL/GTL+	Voltage	1.8 V, 2.5 V, 3.3 V (3.3 V default)			
		HSTL	Class	I / II (I default)			
		SSTL2/SSTL3	Class	I / II (I default)			
		LVPECL*	None				
		LVDS*	None				

Table 10-2 • DDR I/O Options

Note: *IGLOO nano and ProASIC3 nano devices do not support differential inputs.

13 – In-System Programming (ISP) of Microsemi's Low Power Flash Devices Using FlashPro4/3/3X

Introduction

Microsemi's low power flash devices are all in-system programmable. This document describes the general requirements for programming a device and specific requirements for the FlashPro4/3/3X programmers¹.

IGLOO, ProASIC3, SmartFusion, and Fusion devices offer a low power, single-chip, live-at-power-up solution with the ASIC advantages of security and low unit cost through nonvolatile flash technology. Each device contains 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications such as Internet Protocol (IP) addressing, user system preference storage, device serialization, or subscription-based business models. IGLOO, ProASIC3, SmartFusion, and Fusion devices offer the best in-system programming (ISP) solution, FlashLock[®] security features, and AES-decryption-based ISP.

ISP Architecture

Low power flash devices support ISP via JTAG and require a single VPUMP voltage of 3.3 V during programming. In addition, programming via a microcontroller in a target system is also supported.

Refer to the "Microprocessor Programming of Microsemi's Low Power Flash Devices" chapter of an appropriate FPGA fabric user's guide.

Family-specific support:

- ProASIC3, ProASIC3E, SmartFusion, and Fusion devices support ISP.
- ProASIC3L devices operate using a 1.2 V core voltage; however, programming can be done only at 1.5 V. Voltage switching is required in-system to switch from a 1.2 V core to 1.5 V core for programming.
- IGLOO and IGLOOe V5 devices can be programmed in-system when the device is using a 1.5 V supply voltage to the FPGA core.
- IGLOO nano V2 devices can be programmed at 1.2 V core voltage (when using FlashPro4 only) or 1.5 V. IGLOO nano V5 devices are programmed with a VCC core voltage of 1.5 V. Voltage switching is required in-system to switch from a 1.2 V supply (VCC,VCCI, and VJTAG) to 1.5 V for programming. The exception is that V2 devices can be programmed at 1.2 V VCC with FlashPro4.

IGLOO devices cannot be programmed in-system when the device is in Flash*Freeze mode. The device should exit Flash*Freeze mode and be in normal operation for programming to start. Programming operations in IGLOO devices can be achieved when the device is in normal operating mode and a 1.5 V core voltage is used.

JTAG 1532

IGLOO, ProASIC3, SmartFusion, and Fusion devices support the JTAG-based IEEE 1532 standard for ISP. To start JTAG operations, the IGLOO device must exit Flash*Freeze mode and be in normal operation before starting to send JTAG commands to the device. As part of this support, when a device is in an unprogrammed state, all user I/O pins are disabled. This is achieved by keeping the global IO_EN

FlashPro4 replaced FlashPro3/3X in 2010 and is backward compatible with FlashPro3/3X as long as there is no connection to pin 4 on the JTAG header on the board. On FlashPro3/3X, there is no connection to pin 4 on the JTAG header; however, pin 4 is used for programming mode (Prog_Mode) on FlashPro4. When converting from FlashPro3/3X to FlashPro4, users should make sure that JTAG connectors on system boards do not have any connection to pin 4. FlashPro3X supports discrete TCK toggling that is needed to support non-JTAG compliant devices in the chain. This feature is included in FlashPro4.

FlashROM and Programming Files

Each low power flash device has 1 kbit of on-chip, nonvolatile flash memory that can be accessed from the FPGA core. This nonvolatile FlashROM is arranged in eight pages of 128 bits (Figure 13-3). Each page can be programmed independently, with or without the 128-bit AES encryption. The FlashROM can only be programmed via the IEEE 1532 JTAG port and cannot be programmed from the FPGA core. In addition, during programming of the FlashROM, the FPGA core is powered down automatically by the on-chip programming control logic.

Figure 13-3 • FlashROM Architecture

When using FlashROM combined with AES, many subscription-based applications or device serialization applications are possible. The FROM configurator found in the Libero SoC Catalog supports easy management of the FlashROM contents, even over large numbers of devices. The FROM configurator can support FlashROM contents that contain the following:

- Static values
- Random numbers
- Values read from a file
- Independent updates of each page

In addition, auto-incrementing of fields is possible. In applications where the FlashROM content is different for each device, you have the option to generate a single STAPL file for all the devices or individual serialization files for each device. For more information on how to generate the FlashROM content for device serialization, refer to the "FlashROM in Microsemi's Low Power Flash Devices" section on page 133.

Libero SoC includes a unique tool to support the generation and management of FlashROM and FPGA programming files. This tool is called FlashPoint.

Depending on the applications, designers can use the FlashPoint software to generate a STAPL file with different contents. In each case, optional AES encryption and/or different security settings can be set.

In Designer, when you click the Programming File icon, FlashPoint launches, and you can generate STAPL file(s) with four different cases (Figure 13-4 on page 334). When the serialization feature is used during the configuration of FlashROM, you can generate a single STAPL file that will program all the devices or an individual STAPL file for each device.

The following cases present the FPGA core and FlashROM programming file combinations that can be used for different applications. In each case, you can set the optional security settings (FlashLock Pass Key and/or AES Key) depending on the application.

- 1. A single STAPL file or multiple STAPL files with multiple FlashROM contents and the FPGA core content. A single STAPL file will be generated if the device serialization feature is not used. You can program the whole FlashROM or selectively program individual pages.
- 2. A single STAPL file for the FPGA core content

15 – Microprocessor Programming of Microsemi's Low Power Flash Devices

Introduction

The Fusion, IGLOO, and ProASIC3 families of flash FPGAs support in-system programming (ISP) with the use of a microprocessor. Flash-based FPGAs store their configuration information in the actual cells within the FPGA fabric. SRAM-based devices need an external configuration memory, and hybrid nonvolatile devices store the configuration in a flash memory inside the same package as the SRAM FPGA. Since the programming of a true flash FPGA is simpler, requiring only one stage, it makes sense that programming with a microprocessor in-system should be simpler than with other SRAM FPGAs. This reduces bill-of-materials costs and printed circuit board (PCB) area, and increases system reliability.

Nonvolatile flash technology also gives the low power flash devices the advantage of a secure, low power, live-at-power-up, and single-chip solution. Low power flash devices are reprogrammable and offer time-to-market benefits at an ASIC-level unit cost. These features enable engineers to create high-density systems using existing ASIC or FPGA design flows and tools.

This document is an introduction to microprocessor programming only. To explain the difference between the options available, user's guides for DirectC and STAPL provide more detail on implementing each style.

Figure 15-1 • ISP Using Microprocessor

Boundary Scan in Low Power Flash Devices

Microsemi's Flash Devices Support the JTAG Feature

The flash-based FPGAs listed in Table 16-1 support the JTAG feature and the functions described in this document.

Table 16-1 • Flash-Based FPGAs

Series	Family [*]	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO nano	The industry's lowest-power, smallest-size solution
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
ProASIC3	ProASIC3	Low power, high-performance 1.5 V FPGAs
	ProASIC3E	Higher density ProASIC3 FPGAs with six PLLs and additional I/O standards
	ProASIC3 nano	Lowest-cost solution with enhanced I/O capabilities
	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L
	Automotive ProASIC3	ProASIC3 FPGAs qualified for automotive applications
Fusion	Fusion	Mixed signal FPGA integrating ProASIC [®] 3 FPGA fabric, programmable analog block, support for ARM [®] Cortex [™] -M1 soft processors, and flash memory into a monolithic device

Note: *The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

IGLOO Terminology

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 16-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

ProASIC3 Terminology

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 16-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

UJTAG Applications in Microsemi's Low Power Flash Devices

UJTAG Support in Flash-Based Devices

The flash-based FPGAs listed in Table 17-1 support the UJTAG feature and the functions described in this document.

Table 17-1 • Flash-Based FPGAs

Series	Family [*]	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO nano	The industry's lowest-power, smallest-size solution
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
ProASIC3	ProASIC3	Low power, high-performance 1.5 V FPGAs
	ProASIC3E	Higher density ProASIC3 FPGAs with six PLLs and additional I/O standards
	ProASIC3 nano	Lowest-cost solution with enhanced I/O capabilities
	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L
	Automotive ProASIC3	ProASIC3 FPGAs qualified for automotive applications
Fusion	Fusion	Mixed signal FPGA integrating ProASIC3 FPGA fabric, programmable analog block, support for ARM [®] Cortex [™] -M1 soft processors, and flash memory into a monolithic device

Note: *The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

IGLOO Terminology

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 17-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

ProASIC3 Terminology

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 17-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

A – Summary of Changes

History of Revision to Chapters

The following table lists chapters that were affected in each revision of this document. Each chapter includes its own change history because it may appear in other device family user's guides. Refer to the individual chapter for a list of specific changes.

Revision (month/year)	Chapter Affected	List of Changes (page number)
Revision 4 (September 2012)	"Microprocessor Programming of Microsemi's Low Power Flash Devices" was revised.	356
Revision 3 (August 2012)	"FPGA Array Architecture in Low Power Flash Devices" was revised.	20
	"Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" was revised.	129
	"SRAM and FIFO Memories in Microsemi's Low Power Flash Devices" was revised.	173
	"I/O Structures in IGLOO and ProASIC3 Devices" was revised.	210
	"I/O Structures in IGLOOe and ProASIC3E Devices" was revised.	249
	The "Pin Descriptions" and "Packaging" chapters were removed. This information is now published in the datasheet for each product line (SAR 34773).	
	"In-System Programming (ISP) of Microsemi's Low Power Flash Devices Using FlashPro4/3/3X" was revised.	339
	"Boundary Scan in Low Power Flash Devices" was revised.	362
Revision 2 (December 2011)	"Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" was revised.	129
	"UJTAG Applications in Microsemi's Low Power Flash Devices" was revised.	372
Revision 1 (June 2011)	"Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" was revised.	129
	"I/O Structures in IGLOO and ProASIC3 Devices" was revised.	210
	"I/O Structures in IGLOOe and ProASIC3E Devices" was revised.	249
	"I/O Software Control in Low Power Flash Devices" was revised.	270
	"In-System Programming (ISP) of Microsemi's Low Power Flash Devices Using FlashPro4/3/3X" was revised.	339
Revision 0 (July 2010)	The ProASIC3L Flash Family FPGAs Handbook was divided into two parts to create the ProASIC3L Low Power Flash FPGAs Datasheet and the ProASIC3L FPGA Fabric User's Guide.	N/A
	"Global Resources in Low Power Flash Devices" was revised.	75
	"Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" was revised.	129
	"I/O Software Control in Low Power Flash Devices" was revised.	270
