What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, POR, WDT
Number of I/O	13
Program Memory Size	3.5KB (2K x 14)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	128 x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	18-SOIC (0.295", 7.50mm Width)
Supplier Device Package	18-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16c622a-20e-so

2.0   PIC16C62X DEVICE VARIETIES

A variety of frequency ranges and packaging options are available. Depending on application and production requirements, the proper device option can be selected using the information in the PIC16C62X Product Identification System section at the end of this data sheet. When placing orders, please use this page of the data sheet to specify the correct part number.

2.1   UV Erasable Devices

The UV erasable version, offered in CERDIP package, is optimal for prototype development and pilot programs. This version can be erased and reprogrammed to any of the Oscillator modes.

Microchip's PICSTART$^{\circledR}$ and PRO MATE$^{\circledR}$ programmers both support programming of the PIC16C62X.

> **Note:** Microchip does not recommend code protecting windowed devices.

2.2   One-Time-Programmable (OTP) Devices

The availability of OTP devices is especially useful for customers who need the flexibility for frequent code updates and small volume applications. In addition to the program memory, the configuration bits must also be programmed.

2.3   Quick-Turnaround-Production (QTP) Devices

Microchip offers a QTP programming service for factory production orders. This service is made available for users who chose not to program a medium to high quantity of units and whose code patterns have stabilized. The devices are identical to the OTP devices, but with all EPROM locations and configuration options already programmed by the factory. Certain code and prototype verification procedures apply before production shipments are available. Please contact your Microchip Technology sales office for more details.

2.4   Serialized Quick-Turnaround-Production^{SM} (SQTP^{SM}) Devices

Microchip offers a unique programming service where a few user-defined locations in each device are programmed with different serial numbers. The serial numbers may be random, pseudo-random or sequential.

Serial programming allows each device to have a unique number, which can serve as an entry-code, password or ID number.

TABLE 3-1: **PIC16C62X PINOUT DESCRIPTION**

Name	DIP/SOIC Pin #	SSOP Pin #	I/O/P Type	Buffer Type	Description
OSC1/CLKIN	16	18	I	ST/CMOS	Oscillator crystal input/external clock source input.
OSC2/CLKOUT	15	17	O	—	Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. In RC mode, OSC2 pin outputs CLKOUT, which has 1/4 the frequency of OSC1 and denotes the instruction cycle rate.
MCLR/Vpp	4	4	I/P	ST	Master Clear (Reset) input/programming voltage input. This pin is an Active Low Reset to the device.
					PORTA is a bi-directional I/O port.
RA0/AN0	17	19	I/O	ST	Analog comparator input
RA1/AN1	18	20	I/O	ST	Analog comparator input
RA2/AN2/VREF	1	1	I/O	ST	Analog comparator input or VREF output
RA3/AN3	2	2	I/O	ST	Analog comparator input /output
RA4/T0CKI	3	3	I/O	ST	Can be selected to be the clock input to the Timer0 timer/counter or a comparator output. Output is open drain type.
					PORTB is a bi-directional I/O port. PORTB can be software programmed for internal weak pull-up on all inputs.
RB0/INT	6	7	I/O	TTL/ST[1]	RB0/INT can also be selected as an external interrupt pin.
RB1	7	8	I/O	TTL	
RB2	8	9	I/O	TTL	
RB3	9	10	I/O	TTL	
RB4	10	11	I/O	TTL	Interrupt-on-change pin.
RB5	11	12	I/O	TTL	Interrupt-on-change pin.
RB6	12	13	I/O	TTL/ST[2]	Interrupt-on-change pin. Serial programming clock.
RB7	13	14	I/O	TTL/ST[2]	Interrupt-on-change pin. Serial programming data.
VSS	5	5,6	P	—	Ground reference for logic and I/O pins.
VDD	14	15,16	P	—	Positive supply for logic and I/O pins.

Legend: O = output   I/O = input/output   P = power
           — = Not used   I = Input   ST = Schmitt Trigger input
           TTL = TTL input

Note   **1:**   This buffer is a Schmitt Trigger input when configured as the external interrupt.
       2:   This buffer is a Schmitt Trigger input when used in Serial Programming mode.

PIC16C62X

4.2   Data Memory Organization

The data memory (Figure 4-4, Figure 4-5, Figure 4-6 and Figure 4-7) is partitioned into two banks, which contain the General Purpose Registers and the Special Function Registers. Bank 0 is selected when the RP0 bit is cleared. Bank 1 is selected when the RP0 bit (STATUS <5>) is set. The Special Function Registers are located in the first 32 locations of each bank. Register locations 20-7Fh (Bank0) on the PIC16C620A/CR620A/621A and 20-7Fh (Bank0) and A0-BFh (Bank1) on the PIC16C622 and PIC16C622A are General Purpose Registers implemented as static RAM. Some Special Purpose Registers are mapped in Bank 1.

Addresses F0h-FFh of bank1 are implemented as common ram and mapped back to addresses 70h-7Fh in bank0 on the PIC16C620A/621A/622A/CR620A.

4.2.1   GENERAL PURPOSE REGISTER FILE

The register file is organized as 80 x 8 in the PIC16C620/621, 96 x 8 in the PIC16C620A/621A/CR620A and 128 x 8 in the PIC16C622(A). Each is accessed either directly or indirectly through the File Select Register FSR (Section 4.4).

PIC16C62X

4.4 Indirect Addressing, INDF and FSR Registers

The INDF register is not a physical register. Addressing the INDF register will cause indirect addressing.

Indirect addressing is possible by using the INDF register. Any instruction using the INDF register actually accesses data pointed to by the File Select Register (FSR). Reading INDF itself indirectly will produce 00h. Writing to the INDF register indirectly results in a no-operation (although STATUS bits may be affected). An effective 9-bit address is obtained by concatenating the 8-bit FSR register and the IRP bit (STATUS<7>), as shown in Figure 4-9. However, IRP is not used in the PIC16C62X.

A simple program to clear RAM location 20h-7Fh using indirect addressing is shown in Example 4-1.
EXAMPLE 4-1: INDIRECT ADDRESSING

```
        movlw   0x20    ;initialize pointer
        movwf   FSR     ;to RAM
NEXT    clrf    INDF    ;clear INDF register
        incf    FSR     ;inc pointer
        btfss   FSR,7   ;all done?
        goto    NEXT    ;no clear next
                        ;yes continue
CONTINUE:
```

FIGURE 4-9: DIRECT/INDIRECT ADDRESSING PIC16C62X

For memory map detail see (Figure 4-4, Figure 4-5, Figure 4-6 and Figure 4-7).

Note 1: The RP1 and IRP bits are reserved; always maintain these bits clear.

PIC16C62X

FIGURE 5-3: **BLOCK DIAGRAM OF RA3 PIN**

FIGURE 5-4: **BLOCK DIAGRAM OF RA4 PIN**

6.0   TIMER0 MODULE

The Timer0 module timer/counter has the following features:

- 8-bit timer/counter
- Readable and writable
- 8-bit software programmable prescaler
- Internal or external clock select
- Interrupt on overflow from FFh to 00h
- Edge select for external clock

Figure 6-1 is a simplified block diagram of the Timer0 module.

Timer mode is selected by clearing the T0CS bit (OPTION<5>). In Timer mode, the TMR0 will increment every instruction cycle (without prescaler). If Timer0 is written, the increment is inhibited for the following two cycles (Figure 6-2 and Figure 6-3). The user can work around this by writing an adjusted value to TMR0.
Counter mode is selected by setting the T0CS bit. In this mode, Timer0 will increment either on every rising or falling edge of pin RA4/T0CKI. The incrementing edge is determined by the source edge (T0SE) control bit (OPTION<4>). Clearing the T0SE bit selects the rising edge. Restrictions on the external clock input are discussed in detail in Section 6.2.

The prescaler is shared between the Timer0 module and the Watchdog Timer. The prescaler assignment is controlled in software by the control bit PSA (OPTION<3>). Clearing the PSA bit will assign the prescaler to Timer0. The prescaler is not readable or writable. When the prescaler is assigned to the Timer0 module, prescale value of 1:2, 1:4, ..., 1:256 are selectable. Section 6.3 details the operation of the prescaler.
6.1   TIMER0 Interrupt

Timer0 interrupt is generated when the TMR0 register timer/counter overflows from FFh to 00h. This overflow sets the T0IF bit. The interrupt can be masked by clearing the T0IE bit (INTCON<5>). The T0IF bit (INTCON<2>) must be cleared in software by the Timer0 module interrupt service routine before re-enabling this interrupt. The Timer0 interrupt cannot wake the processor from SLEEP, since the timer is shut off during SLEEP. See Figure 6-4 for Timer0 interrupt timing.

FIGURE 6-1:   TIMER0 BLOCK DIAGRAM

Note 1:   Bits T0SE, T0CS, PS2, PS1, PS0 and PSA are located in the OPTION register.
       2:   The prescaler is shared with Watchdog Timer (Figure 6-6).

FIGURE 6-2:   TIMER0 (TMR0) TIMING: INTERNAL CLOCK/NO PRESCALER

PIC16C62X

7.4 Comparator Response Time

Response time is the minimum time, after selecting a new reference voltage or input source, before the comparator output has a valid level. If the internal reference is changed, the maximum delay of the internal voltage reference must be considered when using the comparator outputs. Otherwise the maximum delay of the comparators should be used (Table 12-2).

7.5 Comparator Outputs

The comparator outputs are read through the CMCON register. These bits are read only. The comparator outputs may also be directly output to the RA3 and RA4 I/O pins. When the CM<2:0> = 110, multiplexors in the output path of the RA3 and RA4 pins will switch and the output of each pin will be the unsynchronized output of the comparator. The uncertainty of each of the comparators is related to the input offset voltage and the response time given in the specifications. Figure 7-3 shows the comparator output block diagram.

The TRISA bits will still function as an output enable/disable for the RA3 and RA4 pins while in this mode.

> **Note 1:** When reading the PORT register, all pins configured as analog inputs will read as a '0'. Pins configured as digital inputs will convert an analog input according to the Schmitt Trigger input specification.
>
> **2:** Analog levels on any pin that is defined as a digital input may cause the input buffer to consume more current than is specified.

FIGURE 7-3: COMPARATOR OUTPUT BLOCK DIAGRAM
9.2 Oscillator Configurations
9.2.1 OSCILLATOR TYPES

The PIC16C62X devices can be operated in four different oscillator options. The user can program two configuration bits (FOSC1 and FOSC0) to select one of these four modes:

- LP   Low Power Crystal
- XT   Crystal/Resonator
- HS   High Speed Crystal/Resonator
- RC   Resistor/Capacitor

9.2.2 CRYSTAL OSCILLATOR / CERAMIC RESONATORS

In XT, LP or HS modes, a crystal or ceramic resonator is connected to the OSC1 and OSC2 pins to establish oscillation (Figure 9-1). The PIC16C62X oscillator design requires the use of a parallel cut crystal. Use of a series cut crystal may give a frequency out of the crystal manufacturers specifications. When in XT, LP or HS modes, the device can have an external clock source to drive the OSC1 pin (Figure 9-2).

FIGURE 9-1: **CRYSTAL OPERATION (OR CERAMIC RESONATOR) (HS, XT OR LP OSC CONFIGURATION)**

See Table 9-1 and Table 9-2 for recommended values of C1 and C2.

Note: A series resistor may be required for AT strip cut crystals.

FIGURE 9-2: **EXTERNAL CLOCK INPUT OPERATION (HS, XT OR LP OSC CONFIGURATION)**

TABLE 9-1: **CAPACITOR SELECTION FOR CERAMIC RESONATORS**

Ranges Characterized:			
Mode	Freq	OSC1(C1)	OSC2(C2)
XT	455 kHz	22 - 100 pF	22 - 100 pF
	2.0 MHz	15 - 68 pF	15 - 68 pF
	4.0 MHz	15 - 68 pF	15 - 68 pF
HS	8.0 MHz	10 - 68 pF	10 - 68 pF
	16.0 MHz	10 - 22 pF	10 - 22 pF

Higher capacitance increases the stability of the oscillator but also increases the start-up time. These values are for design guidance only. Since each resonator has its own characteristics, the user should consult the resonator manufacturer for appropriate values of external components.

TABLE 9-2: **CAPACITOR SELECTION FOR CRYSTAL OSCILLATOR**

Mode	Freq	OSC1(C1)	OSC2(C2)
LP	32 kHz	68 - 100 pF	68 - 100 pF
	200 kHz	15 - 30 pF	15 - 30 pF
XT	100 kHz	68 - 150 pF	150 - 200 pF
	2 MHz	15 - 30 pF	15 - 30 pF
	4 MHz	15 - 30 pF	15 - 30 pF
HS	8 MHz	15 - 30 pF	15 - 30 pF
	10 MHz	15 - 30 pF	15 - 30 pF
	20 MHz	15 - 30 pF	15 - 30 pF

Higher capacitance increases the stability of the oscillator but also increases the start-up time. These values are for design guidance only. Rs may be required in HS mode as well as XT mode to avoid overdriving crystals with low drive level specification. Since each crystal has its own characteristics, the user should consult the crystal manufacturer for appropriate values of external components.

PIC16C62X

TABLE 9-4: INITIALIZATION CONDITION FOR SPECIAL REGISTERS

Condition	Program Counter	STATUS Register	PCON Register
Power-on Reset	000h	`0001 1xxx`	`---- --0x`
$\overline{\text{MCLR}}$ Reset during normal operation	000h	`000u uuuu`	`---- --uu`
$\overline{\text{MCLR}}$ Reset during SLEEP	000h	`0001 0uuu`	`---- --uu`
WDT Reset	000h	`0000 uuuu`	`---- --uu`
WDT Wake-up	PC + 1	`uuu0 0uuu`	`---- --uu`
Brown-out Reset	000h	`000x xuuu`	`---- --u0`
Interrupt Wake-up from SLEEP	PC + 1[1]	`uuu1 0uuu`	`---- --uu`

Legend: u = unchanged, x = unknown, - = unimplemented bit, reads as '0'.

Note 1: When the wake-up is due to an interrupt and global enable bit, GIE is set, the PC is loaded with the interrupt vector (0004h) after execution of PC+1.

TABLE 9-5: INITIALIZATION CONDITION FOR REGISTERS

Register	Address	Power-on Reset	• MCLR Reset during normal operation • MCLR Reset during SLEEP • WDT Reset • Brown-out Reset [1]	• Wake-up from SLEEP through interrupt • Wake-up from SLEEP through WDT time-out
W	—	`xxxx xxxx`	`uuuu uuuu`	`uuuu uuuu`
INDF	00h	—	—	—
TMR0	01h	`xxxx xxxx`	`uuuu uuuu`	`uuuu uuuu`
PCL	02h	`0000 0000`	`0000 0000`	`PC + 1`[3]
STATUS	03h	`0001 1xxx`	`000q quuu`[4]	`uuuq quuu`[4]
FSR	04h	`xxxx xxxx`	`uuuu uuuu`	`uuuu uuuu`
PORTA	05h	`---x xxxx`	`---u uuuu`	`---u uuuu`
PORTB	06h	`xxxx xxxx`	`uuuu uuuu`	`uuuu uuuu`
CMCON	1Fh	`00-- 0000`	`00-- 0000`	`uu-- uuuu`
PCLATH	0Ah	`---0 0000`	`---0 0000`	`---u uuuu`
INTCON	0Bh	`0000 000x`	`0000 000u`	`uuuu uqqq`[2]
PIR1	0Ch	`-0-- ----`	`-0-- ----`	`-q-- ----`[2,5]
OPTION	81h	`1111 1111`	`1111 1111`	`uuuu uuuu`
TRISA	85h	`---1 1111`	`---1 1111`	`---u uuuu`
TRISB	86h	`1111 1111`	`1111 1111`	`uuuu uuuu`
PIE1	8Ch	`-0-- ----`	`-0-- ----`	`-u-- ----`
PCON	8Eh	`---- --0x`	`---- --uq`[1,6]	`---- --uu`
VRCON	9Fh	`000- 0000`	`000- 0000`	`uuu- uuuu`

Legend: u = unchanged, x = unknown, - = unimplemented bit, reads as '0', q = value depends on condition.

Note 1: If V$_{DD}$ goes too low, Power-on Reset will be activated and registers will be affected differently.
2: One or more bits in INTCON, PIR1 and/or PIR2 will be affected (to cause wake-up).
3: When the wake-up is due to an interrupt and the GIE bit is set, the PC is loaded with the interrupt vector (0004h).
4: See Table 9-4 for RESET value for specific condition.
5: If wake-up was due to comparator input changing, then bit 6 = 1. All other interrupts generating a wake-up will cause bit 6 = u.
6: If RESET was due to brown-out, then bit 0 = 0. All other RESETS will cause bit 0 = u.

FIGURE 9-8: TIME-OUT SEQUENCE ON POWER-UP ($\overline{\text{MCLR}}$ NOT TIED TO V$_{DD}$): CASE 1

**FIGURE 9-9:** TIME-OUT SEQUENCE ON POWER-UP ($\overline{\text{MCLR}}$ NOT TIED TO V$_{DD}$): CASE 2

FIGURE 9-10: TIME-OUT SEQUENCE ON POWER-UP ($\overline{\text{MCLR}}$ TIED TO V$_{DD}$)

PIC16C62X

**FIGURE 9-11:** **EXTERNAL POWER-ON RESET CIRCUIT (FOR SLOW VDD POWER-UP)**

Note 1: External Power-on Reset circuit is required only if VDD power-up slope is too slow. The diode D helps discharge the capacitor quickly when VDD powers down.

2: < 40 kΩ is recommended to make sure that voltage drop across R does not violate the device's electrical specification.

3: R1 = 100Ω to 1 kΩ will limit any current flowing into MCLR from external capacitor C in the event of MCLR/VPP pin breakdown due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS).

FIGURE 9-12: **EXTERNAL BROWN-OUT PROTECTION CIRCUIT 1**
Note 1: This circuit will activate RESET when VDD goes below (Vz + 0.7V) where Vz = Zener voltage.

2: Internal Brown-out Reset circuitry should be disabled when using this circuit.

FIGURE 9-13: **EXTERNAL BROWN-OUT PROTECTION CIRCUIT 2**
Note 1: This brown-out circuit is less expensive, albeit less accurate. Transistor Q1 turns off when VDD is below a certain level such that:

$$V_{DD} \times \frac{R1}{R1 + R2} = 0.7V$$

2: Internal Brown-out Reset should be disabled when using this circuit.

3: Resistors should be adjusted for the characteristics of the transistor.

FIGURE 9-14: **EXTERNAL BROWN-OUT PROTECTION CIRCUIT 3**
This brown-out protection circuit employs Microchip Technology's MCP809 microcontroller supervisor. The MCP8XX and MCP1XX families of supervisors provide push-pull and open collector outputs with both high and low active RESET pins. There are 7 different trip point selections to accommodate 5V and 3V systems.

PIC16C62X

9.7 Watchdog Timer (WDT)

The Watchdog Timer is a free running on-chip RC oscillator which does not require any external components. This RC oscillator is separate from the RC oscillator of the CLKIN pin. That means that the WDT will run, even if the clock on the OSC1 and OSC2 pins of the device has been stopped, for example, by execution of a SLEEP instruction. During normal operation, a WDT time-out generates a device RESET. If the device is in SLEEP mode, a WDT time-out causes the device to wake-up and continue with normal operation. The WDT can be permanently disabled by programming the configuration bit WDTE as clear (Section 9.1).

9.7.1 WDT PERIOD

The WDT has a nominal time-out period of 18 ms, (with no prescaler). The time-out periods vary with tempera-ture, VDD and process variations from part to part (see

DC specs). If longer time-out periods are desired, a prescaler with a division ratio of up to 1:128 can be assigned to the WDT under software control by writing to the OPTION register. Thus, time-out periods up to 2.3 seconds can be realized.

The CLRWDT and SLEEP instructions clear the WDT and the postscaler, if assigned to the WDT, and prevent it from timing out and generating a device RESET.

The TO bit in the STATUS register will be cleared upon a Watchdog Timer time-out.

9.7.2 WDT PROGRAMMING CONSIDERATIONS

It should also be taken in account that under worst case conditions (VDD = Min., Temperature = Max., max. WDT prescaler) it may take several seconds before a WDT time-out occurs.

FIGURE 9-17: WATCHDOG TIMER BLOCK DIAGRAM

Note: T0SE, T0CS, PSA, PS<2:0> are bits in the OPTION register.
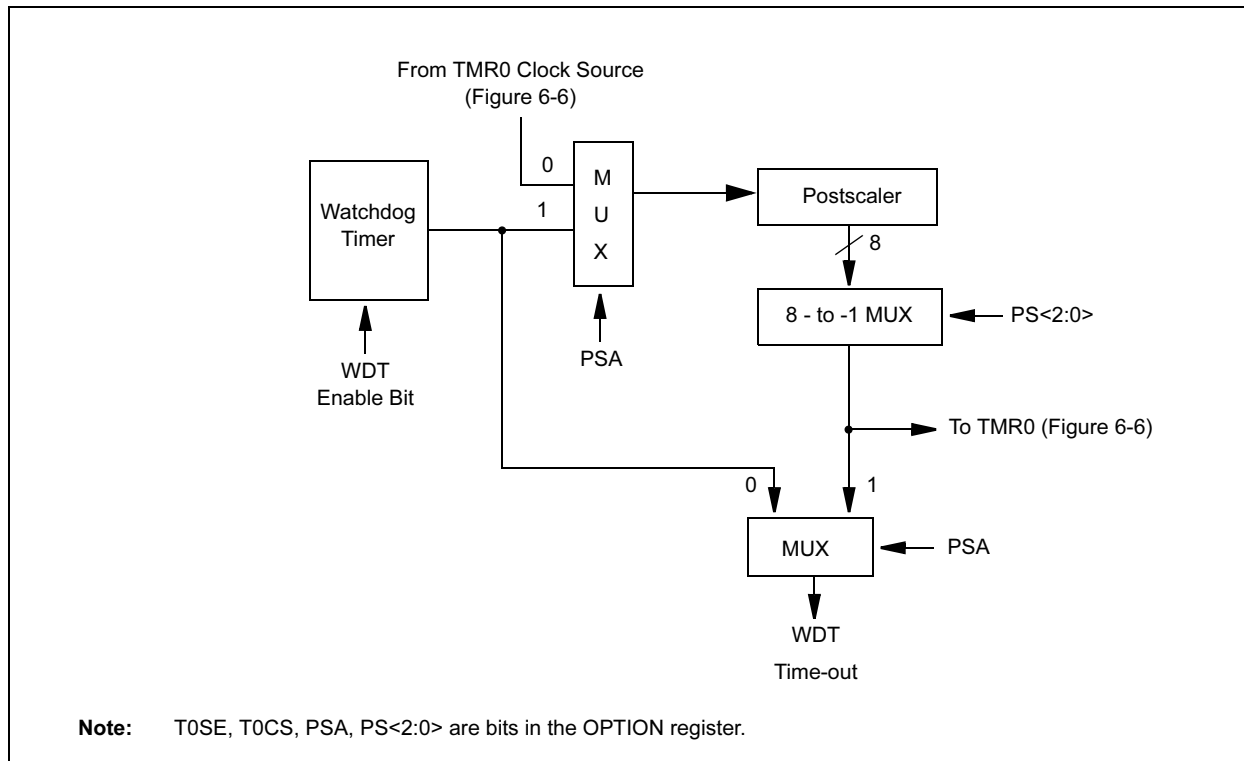

TABLE 9-7: SUMMARY OF WATCHDOG TIMER REGISTERS

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR Reset	Value on all other RESETS
2007h	Config. bits	—	BODEN	CP1	CP0	PWRTE	WDTE	FOSC1	FOSC0	—	—
81h	OPTION	RBPU	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0	1111 1111	1111 1111

Legend: Shaded cells are not used by the Watchdog Timer.

Note: − = Unimplemented location, read as "0"
+ = Reserved for future use

9.8   Power-Down Mode (SLEEP)

The Power-down mode is entered by executing a `SLEEP` instruction.

If enabled, the Watchdog Timer will be cleared but keeps running, the $\overline{PD}$ bit in the STATUS register is cleared, the $\overline{TO}$ bit is set, and the oscillator driver is turned off. The I/O ports maintain the status they had, before SLEEP was executed (driving high, low, or hi-impedance).

For lowest current consumption in this mode, all I/O pins should be either at V$_{DD}$ or V$_{SS}$ with no external circuitry drawing current from the I/O pin and the comparators and V$_{REF}$ should be disabled. I/O pins that are hi-impedance inputs should be pulled high or low externally to avoid switching currents caused by floating inputs. The T0CKI input should also be at V$_{DD}$ or V$_{SS}$ for lowest current consumption. The contribution from on chip pull-ups on PORTB should be considered.

The $\overline{MCLR}$ pin must be at a logic high level (V$_{IHMC}$).

> **Note:**   It should be noted that a RESET generated by a WDT time-out does not drive $\overline{MCLR}$ pin low.

9.8.1   WAKE-UP FROM SLEEP

The device can wake-up from SLEEP through one of the following events:

1. External RESET input on $\overline{MCLR}$ pin
2. Watchdog Timer Wake-up (if WDT was enabled)
3. Interrupt from RB0/INT pin, RB Port change, or the Peripheral Interrupt (Comparator).

The first event will cause a device RESET. The two latter events are considered a continuation of program execution. The $\overline{TO}$ and $\overline{PD}$ bits in the STATUS register can be used to determine the cause of device RESET. $\overline{PD}$ bit, which is set on power-up, is cleared when SLEEP is invoked. $\overline{TO}$ bit is cleared if WDT wake-up occurred.

When the SLEEP instruction is being executed, the next instruction (PC + 1) is pre-fetched. For the device to wake-up through an interrupt event, the corresponding interrupt enable bit must be set (enabled). Wake-up is regardless of the state of the GIE bit. If the GIE bit is clear (disabled), the device continues execution at the instruction after the SLEEP instruction. If the GIE bit is set (enabled), the device executes the instruction after the SLEEP instruction and then branches to the interrupt address (0004h). In cases where the execution of the instruction following SLEEP is not desirable, the user should have an NOP after the SLEEP instruction.

> **Note:**   If the global interrupts are disabled (GIE is cleared), but any interrupt source has both its interrupt enable bit and the corresponding interrupt flag bits set, the device will immediately wake-up from SLEEP. The SLEEP instruction is completely executed.

The WDT is cleared when the device wakes up from SLEEP, regardless of the source of wake-up.

FIGURE 9-18:   **WAKE-UP FROM SLEEP THROUGH INTERRUPT**

Note 1:   XT, HS or LP Oscillator mode assumed.
   2:   T$_{OST}$ = 1024T$_{OSC}$ (drawing not to scale) This delay will not be there for RC Osc mode.
   3:   GIE = '1' assumed. In this case, after wake-up, the processor jumps to the interrupt routine. If GIE = '0', execution will continue in-line.
   4:   CLKOUT is not available in these Osc modes, but shown here for timing reference.

SUBWF	**f, d**	Subtract W from f	1	00	0010	dfff	ffff	C,DC,Z	1,2
SWAPF	**f, d**	Swap nibbles in f	1	00	1110	dfff	ffff		1,2
XORWF	**f, d**	Exclusive OR W with f	1	00	0110	dfff	ffff	Z	1,2
BIT-ORIENTED FILE REGISTER OPERATIONS									
BCF	**f, b**	Bit Clear f	1	01	00bb	bfff	ffff		1,2
BSF	**f, b**	Bit Set f	1	01	01bb	bfff	ffff		1,2
BTFSC	**f, b**	Bit Test f, Skip if Clear	1 (2)	01	10bb	bfff	ffff		3
BTFSS	**f, b**	Bit Test f, Skip if Set	1 (2)	01	11bb	bfff	ffff		3
LITERAL AND CONTROL OPERATIONS									
ADDLW	**k**	Add literal and W	1	11	111x	kkkk	kkkk	C,DC,Z	
ANDLW	**k**	AND literal with W	1	11	1001	kkkk	kkkk	Z	
CALL	**k**	Call subroutine	2	10	0kkk	kkkk	kkkk		
CLRWDT	**-**	Clear Watchdog Timer	1	00	0000	0110	0100	$\overline{TO},\overline{PD}$	
GOTO	**k**	Go to address	2	10	1kkk	kkkk	kkkk		
IORLW	**k**	Inclusive OR literal with W	1	11	1000	kkkk	kkkk	Z	
MOVLW	**k**	Move literal to W	1	11	00xx	kkkk	kkkk		
RETFIE	**-**	Return from interrupt	2	00	0000	0000	1001		
RETLW	**k**	Return with literal in W	2	11	01xx	kkkk	kkkk		
RETURN	**-**	Return from Subroutine	2	00	0000	0000	1000		
SLEEP	**-**	Go into Standby mode	1	00	0000	0110	0011	$\overline{TO},\overline{PD}$	
SUBLW	**k**	Subtract W from literal	1	11	110x	kkkk	kkkk	C,DC,Z	
XORLW	**k**	Exclusive OR literal with W	1	11	1010	kkkk	kkkk	Z	

Note 1: When an I/O register is modified as a function of itself (e.g., `MOVF PORTB, 1`), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

2: If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.

3: If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a `NOP`.

PIC16C62X

CLRW	Clear W
Syntax:	[*label*] CLRW
Operands:	None
Operation:	00h $\rightarrow$ (W) 1 $\rightarrow$ Z
Status Affected:	Z
Encoding:	00 | 0001 | 0000 | 0011
Description:	W register is cleared. Zero bit (Z) is set.
Words:	1
Cycles:	1
Example	CLRW

Before Instruction
    W   =   0x5A
After Instruction
    W   =   0x00
    Z   =   1

CLRWDT	Clear Watchdog Timer
Syntax:	[*label*] CLRWDT
Operands:	None
Operation:	00h $\rightarrow$ WDT 0 $\rightarrow$ WDT prescaler, 1 $\rightarrow$ $\overline{TO}$ 1 $\rightarrow$ $\overline{PD}$
Status Affected:	$\overline{TO}$, $\overline{PD}$
Encoding:	00 | 0000 | 0110 | 0100
Description:	CLRWDT instruction resets the Watchdog Timer. It also resets the prescaler of the WDT. STATUS bits $\overline{TO}$ and $\overline{PD}$ are set.
Words:	1
Cycles:	1
Example	CLRWDT

Before Instruction
    WDT counter =   ?
After Instruction
    WDT counter =   0x00
    WDT prescaler=   0
    $\overline{TO}$ =   1
    $\overline{PD}$ =   1

COMF	Complement f
Syntax:	[*label*] COMF f,d
Operands:	$0 \leq f \leq 127$ $d \in [0,1]$
Operation:	$(\overline{f}) \rightarrow$ (dest)
Status Affected:	Z
Encoding:	00 | 1001 | dfff | ffff
Description:	The contents of register 'f' are complemented. If 'd' is 0, the result is stored in W. If 'd' is 1, the result is stored back in register 'f'.
Words:	1
Cycles:	1
Example	COMF REG1,0

Before Instruction
    REG1   =   0x13
After Instruction
    REG1   =   0x13
    W   =   0xEC

DECF	Decrement f
Syntax:	[*label*] DECF f,d
Operands:	$0 \leq f \leq 127$ $d \in [0,1]$
Operation:	(f) - 1 $\rightarrow$ (dest)
Status Affected:	Z
Encoding:	00 | 0011 | dfff | ffff
Description:	Decrement register 'f'. If 'd' is 0, the result is stored in the W register. If 'd' is 1, the result is stored back in register 'f'.
Words:	1
Cycles:	1
Example	DECF CNT, 1

Before Instruction
    CNT   =   0x01
    Z   =   0
After Instruction
    CNT   =   0x00
    Z   =   1

11.3 MPLAB C17 and MPLAB C18 C Compilers

The MPLAB C17 and MPLAB C18 Code Development Systems are complete ANSI C compilers for Microchip's PIC17CXXX and PIC18CXXX family of microcontrollers. These compilers provide powerful integration capabilities, superior code optimization and ease of use not found with other compilers.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

11.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK object linker combines relocatable objects created by the MPASM assembler and the MPLAB C17 and MPLAB C18 C compilers. It can link relocatable objects from pre-compiled libraries, using directives from a linker script.

The MPLIB object librarian manages the creation and modification of library files of pre-compiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

11.5 MPLAB C30 C Compiler

The MPLAB C30 C compiler is a full-featured, ANSI compliant, optimizing compiler that translates standard ANSI C programs into dsPIC30F assembly language source. The compiler also supports many command-line options and language extensions to take full advantage of the dsPIC30F device hardware capabilities, and afford fine control of the compiler code generator.

MPLAB C30 is distributed with a complete ANSI C standard library. All library functions have been validated and conform to the ANSI C library standard. The library includes functions for string manipulation, dynamic memory allocation, data conversion, time-keeping, and math functions (trigonometric, exponential and hyperbolic). The compiler provides symbolic information for high level source debugging with the MPLAB IDE.

11.6 MPLAB ASM30 Assembler, Linker, and Librarian

MPLAB ASM30 assembler produces relocatable machine code from symbolic assembly language for dsPIC30F devices. MPLAB C30 compiler uses the assembler to produce it's object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire dsPIC30F instruction set
- Support for fixed-point and floating-point data
- Command line interface
- Rich directive set
- Flexible macro language
- MPLAB IDE compatibility

11.7 MPLAB SIM Software Simulator

The MPLAB SIM software simulator allows code development in a PC hosted environment by simulating the PICmicro series microcontrollers on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a file, or user defined key press, to any pin. The execution can be performed in Single-Step, Execute Until Break, or Trace mode.

The MPLAB SIM simulator fully supports symbolic debugging using the MPLAB C17 and MPLAB C18 C Compilers, as well as the MPASM assembler. The software simulator offers the flexibility to develop and debug code outside of the laboratory environment, making it an excellent, economical software development tool.

11.8 MPLAB SIM30 Software Simulator

The MPLAB SIM30 software simulator allows code development in a PC hosted environment by simulating the dsPIC30F series microcontrollers on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a file, or user defined key press, to any of the pins.

The MPLAB SIM30 simulator fully supports symbolic debugging using the MPLAB C30 C Compiler and MPLAB ASM30 assembler. The simulator runs in either a Command Line mode for automated tasks, or from MPLAB IDE. This high speed simulator is designed to debug, analyze and optimize time intensive DSP routines.

11.9 MPLAB ICE 2000 High Performance Universal In-Circuit Emulator

The MPLAB ICE 2000 universal in-circuit emulator is intended to provide the product development engineer with a complete microcontroller design tool set for PICmicro microcontrollers. Software control of the MPLAB ICE 2000 in-circuit emulator is advanced by the MPLAB Integrated Development Environment, which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICE 2000 is a full-featured emulator system with enhanced trace, trigger and data monitoring features. Interchangeable processor modules allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the MPLAB ICE in-circuit emulator allows expansion to support new PICmicro microcontrollers.

The MPLAB ICE 2000 in-circuit emulator system has been designed as a real-time emulation system with advanced features that are typically found on more expensive development tools. The PC platform and Microsoft® Windows 32-bit operating system were chosen to best make these features available in a simple, unified application.

11.10 MPLAB ICE 4000 High Performance Universal In-Circuit Emulator

The MPLAB ICE 4000 universal in-circuit emulator is intended to provide the product development engineer with a complete microcontroller design tool set for high-end PICmicro microcontrollers. Software control of the MPLAB ICE in-circuit emulator is provided by the MPLAB Integrated Development Environment, which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICD 4000 is a premium emulator system, providing the features of MPLAB ICE 2000, but with increased emulation memory and high speed performance for dsPIC30F and PIC18XXXX devices. Its advanced emulator features include complex triggering and timing, up to 2 Mb of emulation memory, and the ability to view variables in real-time.

The MPLAB ICE 4000 in-circuit emulator system has been designed as a real-time emulation system with advanced features that are typically found on more expensive development tools. The PC platform and Microsoft Windows 32-bit operating system were chosen to best make these features available in a simple, unified application.

11.11 MPLAB ICD 2 In-Circuit Debugger

Microchip's In-Circuit Debugger, MPLAB ICD 2, is a powerful, low cost, run-time development tool, connecting to the host PC via an RS-232 or high speed USB interface. This tool is based on the FLASH PICmicro MCUs and can be used to develop for these and other PICmicro microcontrollers. The MPLAB ICD 2 utilizes the in-circuit debugging capability built into the FLASH devices. This feature, along with Microchip's In-Circuit Serial Programming™ (ICSP™) protocol, offers cost effective in-circuit FLASH debugging from the graphical user interface of the MPLAB Integrated Development Environment. This enables a designer to develop and debug source code by setting breakpoints, single-stepping and watching variables, CPU status and peripheral registers. Running at full speed enables testing hardware and applications in real-time. MPLAB ICD 2 also serves as a development programmer for selected PICmicro devices.

## 11.12 PRO MATE II Universal Device Programmer

The PRO MATE II is a universal, CE compliant device programmer with programmable voltage verification at V$_{DDMIN}$ and V$_{DDMAX}$ for maximum reliability. It features an LCD display for instructions and error messages and a modular detachable socket assembly to support various package types. In Stand-Alone mode, the PRO MATE II device programmer can read, verify, and program PICmicro devices without a PC connection. It can also set code protection in this mode.

11.13 PICSTART Plus Development Programmer

The PICSTART Plus development programmer is an easy-to-use, low cost, prototype programmer. It connects to the PC via a COM (RS-232) port. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. The PICSTART Plus development programmer supports most PICmicro devices up to 40 pins. Larger pin count devices, such as the PIC16C92X and PIC17C76X, may be supported with an adapter socket. The PICSTART Plus development programmer is CE compliant.

FIGURE 12-9: **PIC16LCR62XA VOLTAGE-FREQUENCY GRAPH, -40°C ≤ TA ≤ +125°C**

Note 1: The shaded region indicates the permissible combinations of voltage and frequency.

2: The maximum rated speed of the part limits the permissible combinations of voltage and frequency. Please reference the Product Identification System section for the maximum rated speed of the parts.

TABLE 12-4: **CLKOUT AND I/O TIMING REQUIREMENTS**

Parameter No.	Sym	Characteristic	Min	Typ†	Max	Units	Conditions
10*	TosH2ckL	OSC1↑ to CLKOUT↓[1]	— —	75 —	200 400	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
11*	TosH2ckH	OSC1↑ to CLKOUT↑[1]	— —	75 —	200 400	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
12*	TckR	CLKOUT rise time[1]	— —	35 —	100 200	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
13*	TckF	CLKOUT fall time[1]	— —	35 —	100 200	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
14*	TckL2ioV	CLKOUT ↓ to Port out valid[1]	—	—	20	ns	
15*	TioV2ckH	Port in valid before CLKOUT ↑[1]	T_{OSC} +200 ns T_{OSC} +400 ns	— —	— —	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
16*	TckH2ioI	Port in hold after CLKOUT ↑[1]	0	—	—	ns	
17*	TosH2ioV	OSC1↑ (Q1 cycle) to Port out valid	— —	50	150 300	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
18*	TosH2ioI	OSC1↑ (Q2 cycle) to Port input invalid (I/O in hold time)	100 200	— —	— —	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
19*	TioV2osH	Port input valid to OSC1↑ (I/O in setup time)	0	—	—	ns	
20*	TioR	Port output rise time	— —	10 —	40 80	ns ns	PIC16C62X(A) PIC16LC62X(A) PIC16CR62XA PIC16LCR62XA
