Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

    - ECB, CBC, and counter modes
    - 128-, 192-, and 256-bit key lengths
  - Message digest execution unit (MDEU)
    - SHA with 160- or 256-bit message digest
    - MD5 with 128-bit message digest
    - HMAC with either algorithm
  - Master/slave logic, with DMA
    - 32-bit address/32-bit data
    - Operation at MPC8xx bus frequency
  - Crypto-channel supporting multi-command descriptors
    - Integrated controller managing crypto-execution units
    - Buffer size of 256 bytes for each execution unit, with flow control for large data sizes
- Interrupts
  - Six external interrupt request (IRQ) lines
  - Twelve port pins with interrupt capability
  - Twenty-three internal interrupt sources
  - Programmable priority between SCCs
  - Programmable highest priority request
- Communications processor module (CPM)
  - RISC controller
  - Communication-specific commands (for example, GRACEFUL STOP TRANSMIT, ENTER HUNT MODE, and RESTART TRANSMIT)
  - Supports continuous mode transmission and reception on all serial channels
  - 8-Kbytes of dual-port RAM
  - Several serial DMA (SDMA) channels to support the CPM
  - Three parallel I/O registers with open-drain capability
- On-chip 16 × 16 multiply accumulate controller (MAC)
  - One operation per clock (two-clock latency, one-clock blockage)
  - MAC operates concurrently with other instructions
  - FIR loop—Four clocks per four multiplies
- Four baud-rate generators
  - Independent (can be connected to SCC or SMC)
  - Allows changes during operation
  - Autobaud support option
- SCC (serial communication controller)
  - Ethernet/IEEE 802.3® standard, supporting full 10-Mbps operation
  - HDLC/SDLC

7.2 Estimation with Junction-to-Case Thermal Resistance

Historically, thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)

$R_{\theta CA}$ = case-to-ambient thermal resistance (°C/W)

$R_{\theta JC}$ is device-related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the airflow around the device, add a heat sink, change the mounting arrangement on the printed-circuit board, or change the thermal dissipation on the printed-circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

7.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model that has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed-circuit board. It has been observed that the thermal performance of most plastic packages and especially PBGA packages is strongly dependent on the board temperature. If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance (°C/W)

T_B = board temperature (°C)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and vias attaching the thermal balls to the ground plane.

7.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application [2], or a more accurate and complex model of the package can be used in the thermal simulation.

11 Bus Signal Timing

The maximum bus speed supported by the MPC875/MPC870 is 80 MHz. Higher-speed parts must be operated in half-speed bus mode (for example, an MPC875/MPC870 used at 133 MHz must be configured for a 66 MHz bus). Table 8 shows the frequency ranges for standard part frequencies in 1:1 bus mode, and Table 9 shows the frequency ranges for standard part frequencies in 2:1 bus mode.

Table 8. Frequency Ranges for Standard Part Frequencies (1:1 Bus Mode)

14 USB Electrical Characteristics

This section provides the AC timings for the USB interface.

14.1 USB Interface AC Timing Specifications

The USB Port uses the transmit clock on SCC1. Table 30 lists the USB interface timings.

Table 30. USB Interface AC Timing Specifications

Name	Characteristic	All Frequencies		Unit
		Min	Max	
US1	USBCLK frequency of operation[1] Low speed Full speed	6 48		MHz
US4	USBCLK duty cycle (measured at 1.5 V)	45	55	%

[1] USBCLK accuracy should be ±500 ppm or better. USBCLK may be stopped to conserve power.

15 FEC Electrical Characteristics

This section provides the AC electrical specifications for the Fast Ethernet controller (FEC). Note that the timing specifications for the MII signals are independent of system clock frequency (part speed designation). Also, MII signals use TTL signal levels compatible with devices operating at either 5.0 or 3.3 V.

15.1 MII and Reduced MII Receive Signal Timing

The receiver functions correctly up to a MII_RX_CLK maximum frequency of 25 MHz + 1%. The reduced MII (RMII) receiver functions correctly up to a RMII_REFCLK maximum frequency of 50 MHz + 1%. There is no minimum frequency requirement. In addition, the processor clock frequency must exceed the MII_RX_CLK frequency – 1%.

Table 31 provides information on the MII receive signal timing.

17 Document Revision History

Table 37 lists significant changes between revisions of this hardware specification.

Table 37. Document Revision History

Revision Number	Date	Changes
0	2/2003	Initial release.
0.1	3/2003	Took out the time-slot assigner and changed the SCC for SCC3 to SCC4.
0.2	5/2003	Changed the package drawing, removed all references to Data Parity. Changed the SPI Master Timing Specs. 162 and 164. Added the RMII and USB timing. Added the 80-MHz timing.
0.3	5/2003	Made sure the pin types were correct. Changed the Features list to agree with the MPC885.
0.4	5/2003	Corrected the signals that had overlines on them. Made corrections on two pins that were typos.
0.5	5/2003	Changed the pin descriptions for PD8 and PD9.
0.6	5/2003	Changed a few typos. Put back the I^2C. Put in the new reset configuration, corrected the USB timing.
0.7	6/2003	Changed the pin descriptions per the June 22 spec, removed Utopia from the pin descriptions, changed PADIR, PBDIR, PCDIR and PDDIR to be 0 in the Mandatory Reset Config.
0.8	8/2003	Added the reference to USB 2.0 to the Features list and removed 1.1 from USB on the block diagrams.
0.9	8/2003	Changed the USB description to full-/low-speed compatible.
1.0	9/2003	Added the DSP information in the Features list. Put a new sentence under Mechanical Dimensions. Fixed table formatting. Nontechnical edits. Released to the external web.
1.1	10/2003	Added TDMb to the MPC875 Features list, the MPC875 Block Diagram, added 13.5 Serial Interface AC Electrical Specifications, and removed TDMa from the pin descriptions.
2.0	12/2003	Changed DBGC in the Mandatory Reset Configuration to X1. Changed the maximum operating frequency to 133 MHz. Put the timing in the 80 MHz column. Put in the orderable part numbers. Rounded the timings to hundredths in the 80 MHz column. Put the pin numbers in footnotes by the maximum currents in Table 6. Changed 22 and 41 in the Timing. Put TBD in the Thermal table.
