Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

3 Maximum Tolerated Ratings

This section provides the maximum tolerated voltage and temperature ranges for the MPC875/MPC870. Table 2 displays the maximum tolerated ratings and Table 3 displays the operating temperatures.

Table 2. Maximum Tolerated Ratings

Rating	Symbol	Value	Unit
Supply voltage[1]	V_{DDL} (core voltage)	–0.3 to 3.4	V
	V_{DDH} (I/O voltage)	–0.3 to 4	V
	V_{DDSYN}	–0.3 to 3.4	V
	Difference between V_{DDL} and V_{DDSYN}	<100	mV
Input voltage[2]	V_{in}	GND – 0.3 to V_{DDH}	V
Storage temperature range	T_{stg}	–55 to +150	°C

1 The power supply of the device must start its ramp from 0.0 V.

2 Functional operating conditions are provided with the DC electrical specifications in Table 6. Absolute maximum ratings are stress ratings only; functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.
Caution: All inputs that tolerate 5 V cannot be more than 2.5 V greater than V_{DDH}. This restriction applies to power up and normal operation (that is, if the MPC875/MPC870 is unpowered, a voltage greater than 2.5 V must not be applied to its inputs).

Figure 3 shows the undershoot and overshoot voltages at the interfaces of the MPC875/MPC870.

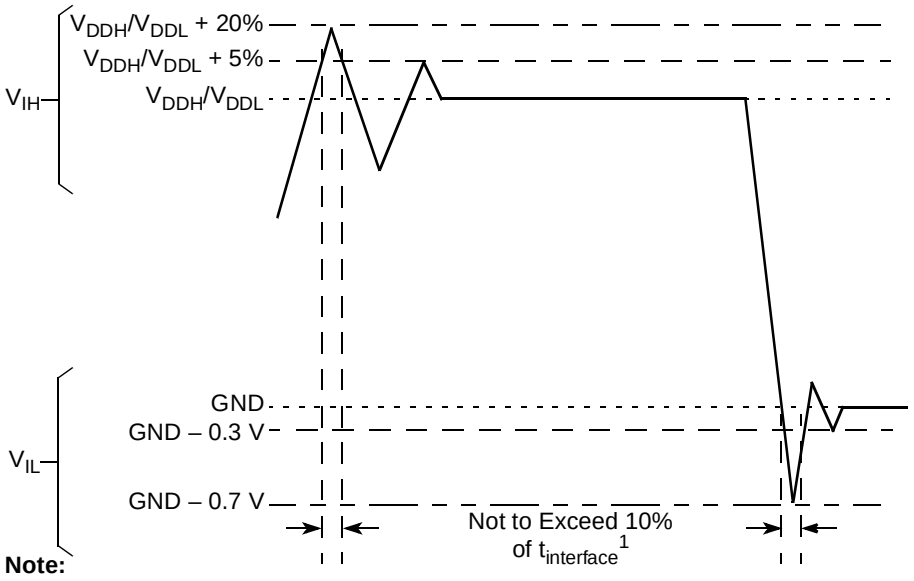

Figure 3. Undershoot/Overshoot Voltage for V_{DDH} and V_{DDL}

Table 6. DC Electrical Specifications (continued)

Characteristic	Symbol	Min	Max	Unit
Output high voltage, I_{OH} = –2.0 mA, V_{DDH} = 3.0 V (except XTAL and open-drain pins)	V_{OH}	2.4	—	V
Output low voltage I_{OL} = 2.0 mA (CLKOUT) I_{OL} = 3.2 mA[5] I_{OL} = 5.3 mA[6] I_{OL} = 7.0 mA (TXD1/PA14, TXD2/PA12) I_{OL} = 8.9 mA ($\overline{TS}$, $\overline{TA}$, $\overline{TEA}$, $\overline{BI}$, $\overline{BB}$, $\overline{HRESET}$, $\overline{SRESET}$)	V_{OL}	—	0.5	V

1 The difference between V_{DDL} and V_{DDSYN} cannot be more than 100 mV.

2 The signals PA[0:15], PB[14:31], PC[4:15], PD[3:15], PE(14:31), TDI, TDO, TCK, $\overline{TRST}$, TMS, MII1_TXEN, and MII_MDIO are 5-V tolerant. The minimum voltage is still 2.0 V.

3 V_{IL}(max) for the I^2C interface is 0.8 V rather than the 1.5 V as specified in the I^2C standard.

4 Input capacitance is periodically sampled.

7 Thermal Calculation and Measurement

For the following discussions, $P_D = (V_{DDL} \times I_{DDL}) + P_{I/O}$, where $P_{I/O}$ is the power dissipation of the I/O drivers.

NOTE

The V_{DDSYN} power dissipation is negligible.

7.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, in °C can be obtained from the following equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_A = ambient temperature (°C)

$R_{\theta JA}$ = package junction-to-ambient thermal resistance (°C/W)

P_D = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

Table 24. Ethernet Timing (continued)

Num	Characteristic	All Frequencies		Unit
		Min	Max	
138	CLKO1 low to $\overline{\text{SDACK}}$ asserted[2]	—	20	ns
139	CLKO1 low to $\overline{\text{SDACK}}$ negated[2]	—	20	ns

1 The ratios SYNCCLK/RCLK3 and SYNCCLK/TCLK3 must be greater than or equal to 2/1.

2 $\overline{\text{SDACK}}$ is asserted whenever the SDMA writes the incoming frame DA into memory.
