Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

1 Overview

The MPC875/MPC870 is a versatile single-chip integrated microprocessor and peripheral combination that can be used in a variety of controller applications and communications and networking systems. The MPC875/MPC870 provides enhanced ATM functionality over that of other ATM-enabled members of the MPC860 family.

Table 1 shows the functionality supported by the MPC875/MPC870.

Table 1. MPC875/MPC870 Devices

Part	Cache (Kbytes)		Ethernet		SCC	SMC	USB	Security Engine
	I Cache	D Cache	10BaseT	10/100				
MPC875	8	8	1	2	1	1	1	Yes
MPC870	8	8	—	2	—	1	1	No

2 Features

The MPC875/MPC870 is comprised of three modules that each use the 32-bit internal bus: a MPC8xx core, a system integration unit (SIU), and a communications processor module (CPM).

The following list summarizes the key MPC875/MPC870 features:

- Embedded MPC8xx core up to 133 MHz
- Maximum frequency operation of the external bus is 80 MHz (in 1:1 mode)
  - The 133-MHz core frequency supports 2:1 mode only
  - The 66-/80-MHz core frequencies support both the 1:1 and 2:1 modes
- Single-issue, 32-bit core (compatible with the Power Architecture definition) with thirty-two 32-bit general-purpose registers (GPRs)
  - The core performs branch prediction with conditional prefetch and without conditional execution
  - 8-Kbyte data cache and 8-Kbyte instruction cache (see Table 1)
    - Instruction cache is two-way, set-associative with 256 sets in 2 blocks
    - Data cache is two-way, set-associative with 256 sets
    - Cache coherency for both instruction and data caches is maintained on 128-bit (4-word) cache blocks
    - Caches are physically addressed, implement a least recently used (LRU) replacement algorithm, and are lockable on a cache block basis
  - MMUs with 32-entry TLB, fully associative instruction and data TLBs
  - MMUs support multiple page sizes of 4, 16, and 512 Kbytes, and 8 Mbytes; 16 virtual address spaces and 16 protection groups
  - Advanced on-chip emulation debug mode
- Up to 32-bit data bus (dynamic bus sizing for 8, 16, and 32 bits)

  - ECB, CBC, and counter modes
  - 128-, 192-, and 256-bit key lengths
- Message digest execution unit (MDEU)
  - SHA with 160- or 256-bit message digest
  - MD5 with 128-bit message digest
  - HMAC with either algorithm
- Master/slave logic, with DMA
  - 32-bit address/32-bit data
  - Operation at MPC8xx bus frequency
- Crypto-channel supporting multi-command descriptors
  - Integrated controller managing crypto-execution units
  - Buffer size of 256 bytes for each execution unit, with flow control for large data sizes

- Interrupts
  - Six external interrupt request (IRQ) lines
  - Twelve port pins with interrupt capability
  - Twenty-three internal interrupt sources
  - Programmable priority between SCCs
  - Programmable highest priority request
- Communications processor module (CPM)
  - RISC controller
  - Communication-specific commands (for example, GRACEFUL STOP TRANSMIT, ENTER HUNT MODE, and RESTART TRANSMIT)
  - Supports continuous mode transmission and reception on all serial channels
  - 8-Kbytes of dual-port RAM
  - Several serial DMA (SDMA) channels to support the CPM
  - Three parallel I/O registers with open-drain capability
- On-chip 16 × 16 multiply accumulate controller (MAC)
  - One operation per clock (two-clock latency, one-clock blockage)
  - MAC operates concurrently with other instructions
  - FIR loop—Four clocks per four multiplies
- Four baud-rate generators
  - Independent (can be connected to SCC or SMC)
  - Allows changes during operation
  - Autobaud support option
- SCC (serial communication controller)
  - Ethernet/IEEE 802.3® standard, supporting full 10-Mbps operation
  - HDLC/SDLC

- The MPC875 has a time-slot assigner (TSA) that supports one TDM bus (TDMb)
  - Allows SCC and SMC to run in multiplexed and/or non-multiplexed operation
  - Supports T1, CEPT, PCM highway, ISDN basic rate, ISDN primary rate, user-defined
  - 1- or 8-bit resolution
  - Allows independent transmit and receive routing, frame synchronization, and clocking
  - Allows dynamic changes
  - Can be internally connected to two serial channels (one SCC and one SMC)
- PCMCIA interface
  - Master (socket) interface, release 2.1-compliant
  - Supports one independent PCMCIA socket on the MPC875/MPC870
  - Eight memory or I/O windows supported
- Debug interface
  - Eight comparators: four operate on instruction address, two operate on data address, and two operate on data
  - Supports conditions: = ≠ < >
  - Each watchpoint can generate a break point internally
- Normal high and normal low power modes to conserve power
- 1.8-V core and 3.3-V I/O operation with 5-V TTL compatibility
- The MPC875/MPC870 comes in a 256-pin ball grid array (PBGA) package

7.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

Ψ_{JT} = thermal characterization parameter

T_T = thermocouple temperature on top of package

P_D = power dissipation in package

The thermal characterization parameter is measured per the JESD51-2 specification published by JEDEC using a 40 gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by the cooling effects of the thermocouple wire.

8 Power Supply and Power Sequencing

This section provides design considerations for the MPC875/MPC870 power supply. The MPC875/MPC870 has a core voltage (V_{DDL}) and PLL voltage (V_{DDSYN}), which both operate at a lower voltage than the I/O voltage (V_{DDH}). The I/O section of the MPC875/MPC870 is supplied with 3.3 V across V_{DDH} and V_{SS} (GND).

The signals PA[0:3], PA[8:11], PB15, PB[24:25], PB[28:31], PC[4:7], PC[12:13], PC15, PD[3:15], TDI, TDO, TCK, $\overline{\text{TRST}}$, TMS, MII_TXEN, and MII_MDIO are 5 V tolerant. No input can be more than 2.5 V greater than V_{DDH}. In addition, 5-V tolerant pins cannot exceed 5.5 V, and remaining input pins cannot exceed 3.465 V. This restriction applies to power up, power down, and normal operation.

One consequence of multiple power supplies is that when power is initially applied, the voltage rails ramp up at different rates. The rates depend on the nature of the power supply, the type of load on each power supply, and the manner in which different voltages are derived. The following restrictions apply:

- V_{DDL} must not exceed V_{DDH} during power up and power down
- V_{DDL} must not exceed 1.9 V, and V_{DDH} must not exceed 3.465 V

These cautions are necessary for the long-term reliability of the part. If they are violated, the electrostatic discharge (ESD) protection diodes are forward-biased, and excessive current can flow through these diodes. If the system power supply design does not control the voltage sequencing, the circuit shown in Figure 4 can be added to meet these requirements. The MUR420 Schottky diodes control the maximum potential difference between the external bus and core power supplies on power up, and the 1N5820 diodes regulate the maximum potential difference on power down.

9 Mandatory Reset Configurations

The MPC875/MPC870 requires a mandatory configuration during reset.

If hardware reset configuration word (HRCW) is enabled, the HRCW[DBGC] value needs to be set to binary X1 in the HRCW and the SIUMCR[DBGC] should be programmed with the same value in the boot code after reset. This can be done by asserting the $\overline{\text{RSTCONF}}$ during $\overline{\text{HRESET}}$ assertion.

If HRCW is disabled, the SIUMCR[DBGC] should be programmed with binary X1 in the boot code after reset by negating the $\overline{\text{RSTCONF}}$ during the $\overline{\text{HRESET}}$ assertion.

The MBMR[GPLB4DIS], PAPAR, PADIR, PBPAR, PBDIR, PCPAR, and PCDIR need to be configured with the mandatory values in Table 7 in the boot code after the reset is negated.

Table 7. Mandatory Reset Configuration of MPC875/MPC870

Register/Configuration	Field	Value (Binary)
HRCW (Hardware reset configuration word)	HRCW[DBGC]	X1
SIUMCR (SIU module configuration register)	SIUMCR[DBGC]	X1
MBMR (Machine B mode register)	MBMR[GPLB4DIS}	0
PAPAR (Port A pin assignment register)	PAPAR[5:9] PAPAR[12:13]	0

Num	Characteristic	33 MHz		40 MHz		66 MHz		80 MHz		Unit
		Min	Max	Min	Max	Min	Max	Min	Max

1 For part speeds above 50 MHz, use 9.80 ns for B11a.

2 The timing required for $\overline{BR}$ input is relevant when the MPC875/MPC870 is selected to work with the internal bus arbiter. The timing for $\overline{BG}$ input is relevant when the MPC875/MPC870 is selected to work with the external bus arbiter.

3 For part speeds above 50 MHz, use 2 ns for B17.

4 The D(0:31) input timings B18 and B19 refer to the rising edge of the CLKOUT in which the $\overline{TA}$ input signal is asserted.

5 For part speeds above 50 MHz, use 2 ns for B19.

6 The D(0:31) input timings B20 and B21 refer to the falling edge of the CLKOUT. This timing is valid only for read accesses controlled by chip-selects under control of the user-programmable machine (UPM) in the memory controller, for data beats where DLT3 = 1 in the RAM words. (This is only the case where data is latched on the falling edge of CLKOUT.)

7 This formula applies to bus operation up to 50 MHz.

8 The timing B30 refers to $\overline{CS}$ when ACS = 00 and to $\overline{WE}$(0:3) when CSNT = 0.

9 The signal UPWAIT is considered asynchronous to the CLKOUT and synchronized internally. The timings specified in B37 and B38 are specified to enable the freeze of the UPM output signals as described in Figure 20.

10 The $\overline{AS}$ signal is considered asynchronous to the CLKOUT. The timing B39 is specified in order to allow the behavior specified in Figure 23.
