Understanding [Embedded - Microprocessors](#)

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of [Embedded - Microprocessors](#)

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

3 Maximum Tolerated Ratings

This section provides the maximum tolerated voltage and temperature ranges for the MPC875/MPC870. Table 2 displays the maximum tolerated ratings and Table 3 displays the operating temperatures.

Table 2. Maximum Tolerated Ratings

Rating	Symbol	Value	Unit
Supply voltage ¹	V_{DDL} (core voltage)	−0.3 to 3.4	V
	V_{DDH} (I/O voltage)	−0.3 to 4	V
	V_{DDSYN}	−0.3 to 3.4	V
	Difference between V_{DDL} and V_{DDSYN}	<100	mV
Input voltage ²	V_{in}	GND − 0.3 to V_{DDH}	V
Storage temperature range	T_{stg}	−55 to +150	°C

¹ The power supply of the device must start its ramp from 0.0 V.

² Functional operating conditions are provided with the DC electrical specifications in Table 6. Absolute maximum ratings are stress ratings only; functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.

Caution: All inputs that tolerate 5 V cannot be more than 2.5 V greater than V_{DDH} . This restriction applies to power up and normal operation (that is, if the MPC875/MPC870 is unpowered, a voltage greater than 2.5 V must not be applied to its inputs).

Figure 3 shows the undershoot and overshoot voltages at the interfaces of the MPC875/MPC870.

Figure 3. Undershoot/Overshoot Voltage for V_{DDH} and V_{DDL}

Table 3. Operating Temperatures

Rating	Symbol	Value	Unit
Temperature ¹ (standard)	$T_{A(min)}$	0	°C
	$T_{J(max)}$	95	°C
Temperature (extended)	$T_{A(min)}$	–40	°C
	$T_{J(max)}$	100	°C

¹ Minimum temperatures are guaranteed as ambient temperature, T_A . Maximum temperatures are guaranteed as junction temperature, T_J .

This device contains circuitry protecting against damage due to high-static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for example, either GND or V_{DDH}).

4 Thermal Characteristics

Table 4 shows the thermal characteristics for the MPC875/MPC870.

Table 4. MPC875/MPC870 Thermal Resistance Data

Rating	Environment		Symbol	Value	Unit
Junction-to-ambient ¹	Natural convection	Single-layer board (1s)	$R_{\theta JA}$ ²	43	°C/W
		Four-layer board (2s2p)	$R_{\theta JMA}$ ³	29	
	Airflow (200 ft/min)	Single-layer board (1s)	$R_{\theta JMA}$ ³	36	
		Four-layer board (2s2p)	$R_{\theta JMA}$ ³	26	
Junction-to-board ⁴			$R_{\theta JB}$	20	
Junction-to-case ⁵			$R_{\theta JC}$	10	
Junction-to-package top ⁶	Natural convection		Ψ_{JT}	2	
	Airflow (200 ft/min)		Ψ_{JT}	2	

¹ Junction temperature is a function of on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, airflow, power dissipation of other components on the board, and board thermal resistance.

² Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.

³ Per JEDEC JESD51-6 with the board horizontal.

⁴ Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

⁵ Indicates the average thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1) with the cold plate temperature used for the case temperature. For exposed pad packages where the pad would be expected to be soldered, junction-to-case thermal resistance is a simulated value from the junction to the exposed pad without contact resistance.

⁶ Thermal characterization parameter indicating the temperature difference between the package top and the junction temperature per JEDEC JESD51-2.

11 Bus Signal Timing

The maximum bus speed supported by the MPC875/MPC870 is 80 MHz. Higher-speed parts must be operated in half-speed bus mode (for example, an MPC875/MPC870 used at 133 MHz must be configured for a 66 MHz bus). [Table 8](#) shows the frequency ranges for standard part frequencies in 1:1 bus mode, and [Table 9](#) shows the frequency ranges for standard part frequencies in 2:1 bus mode.
